

Parts 6 and 7: The Blades

SolidWorks bends them. FreeCAD cannot.

WHAT THE TUTORIAL DOES

- Builds the blade flat.
- Runs **Flex › Bending** to warp it around a radius.
- Blade 02 is the same thing bent on 16 inches instead of 10.

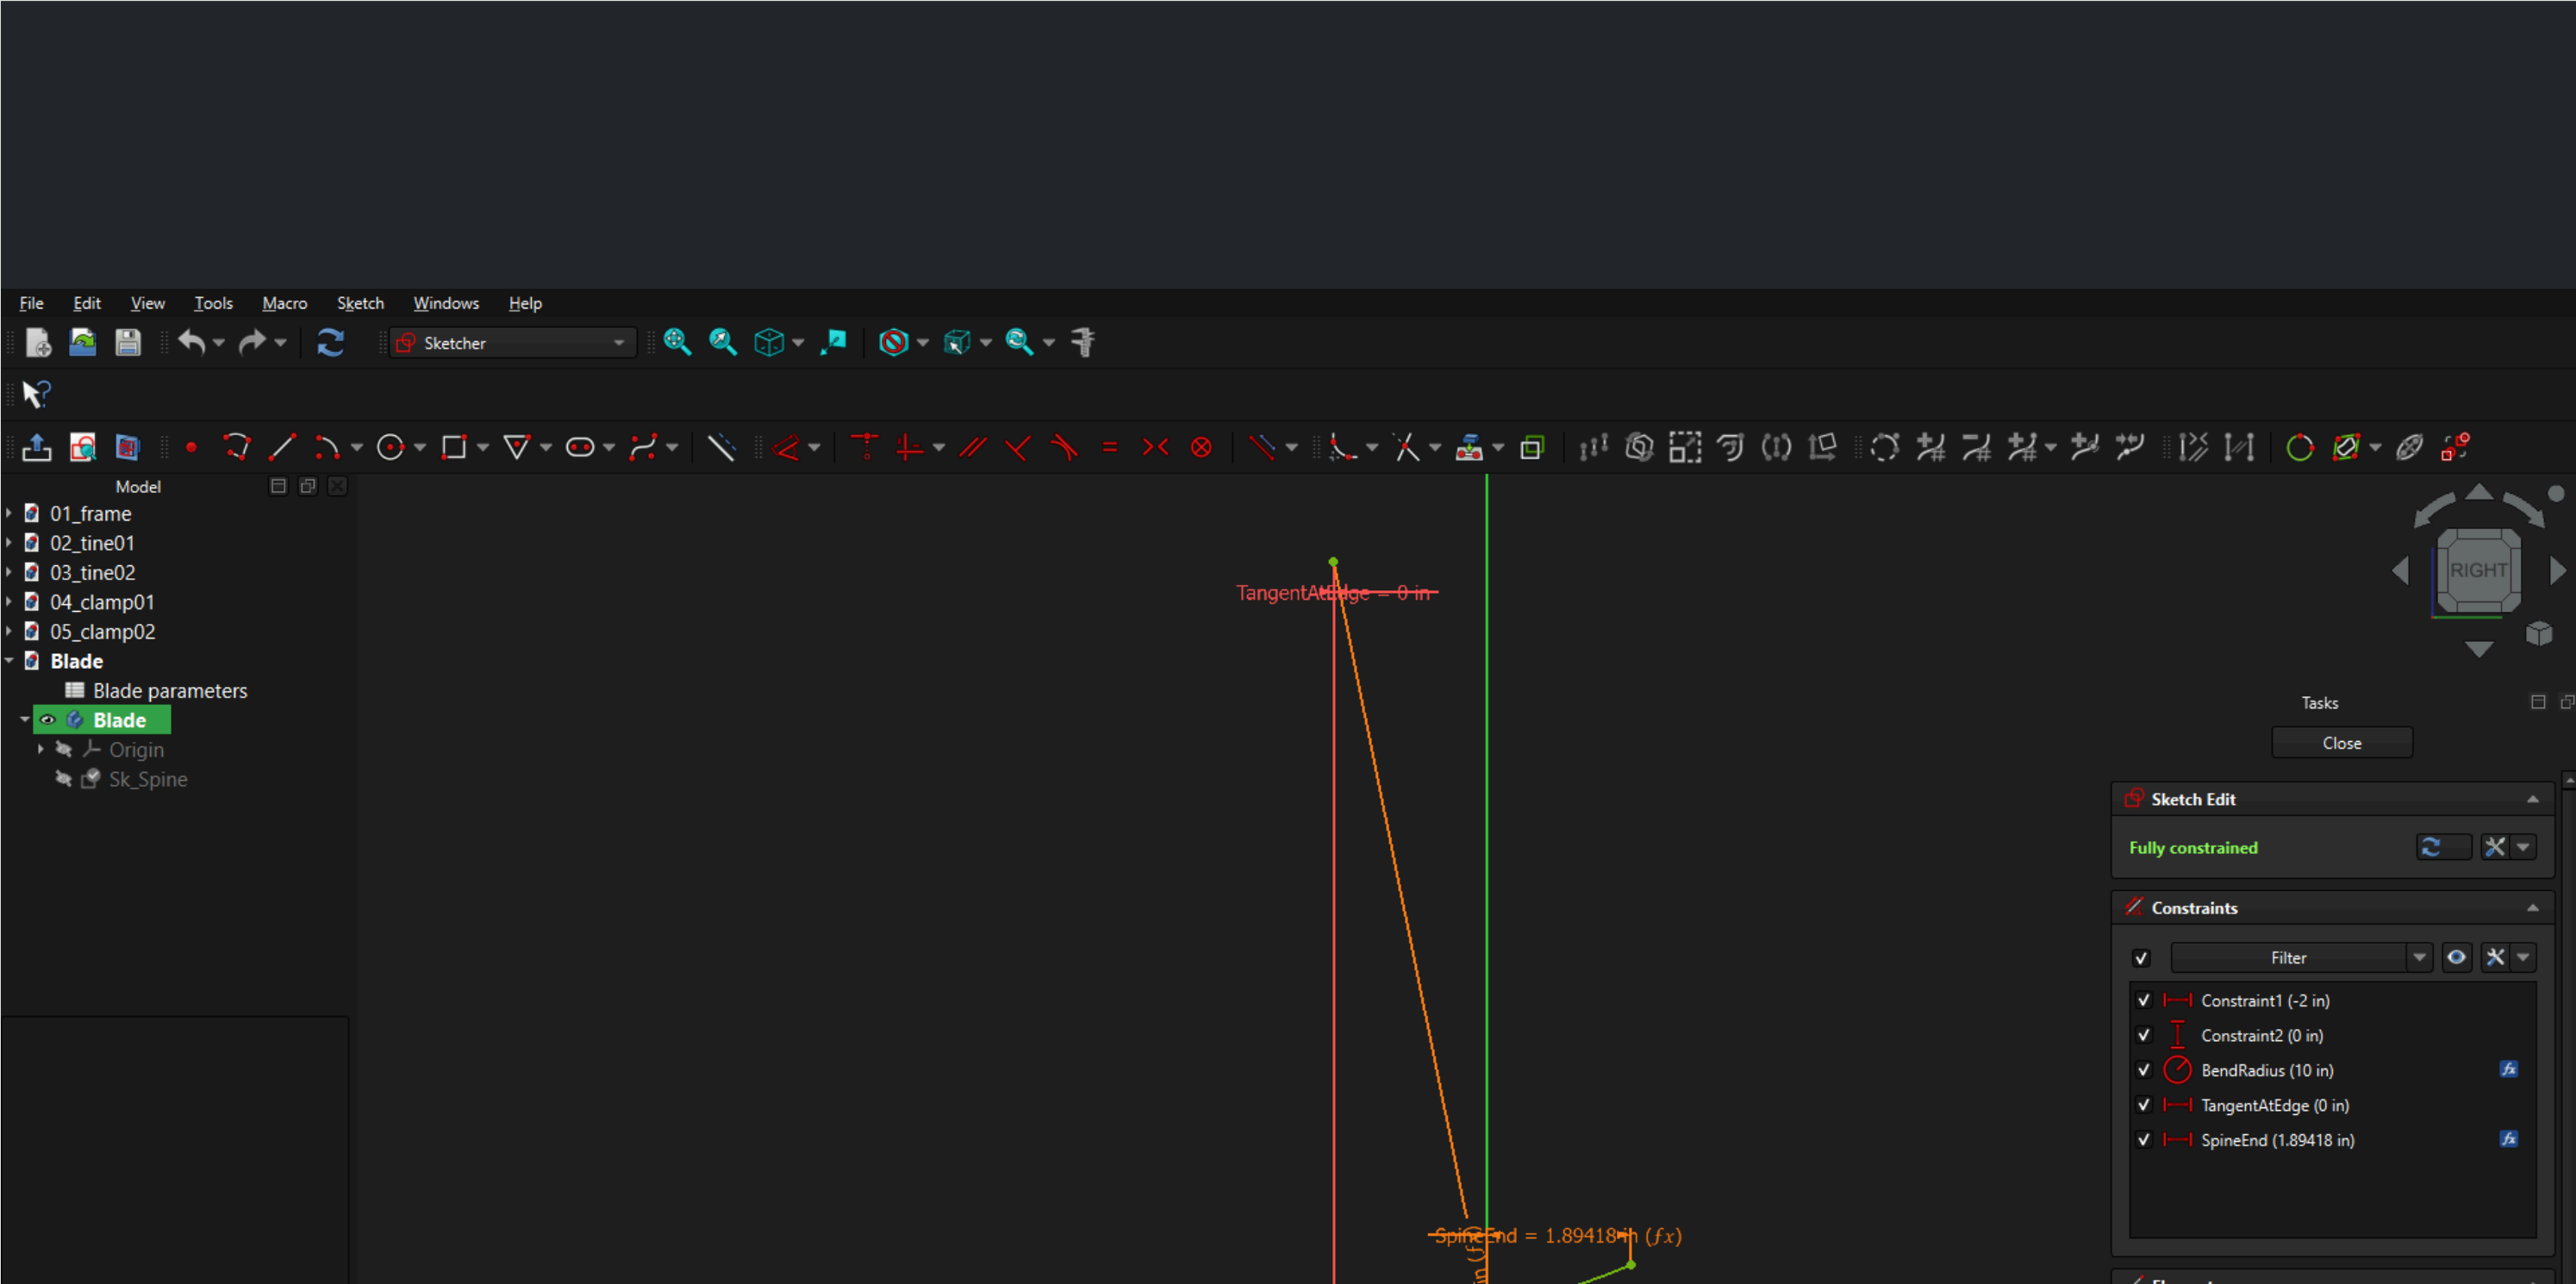

FreeCAD has no Flex. Not in Part Design, not in Part, not in any add-on. If you went looking for the button, it is not there.

WHAT WE DO INSTEAD

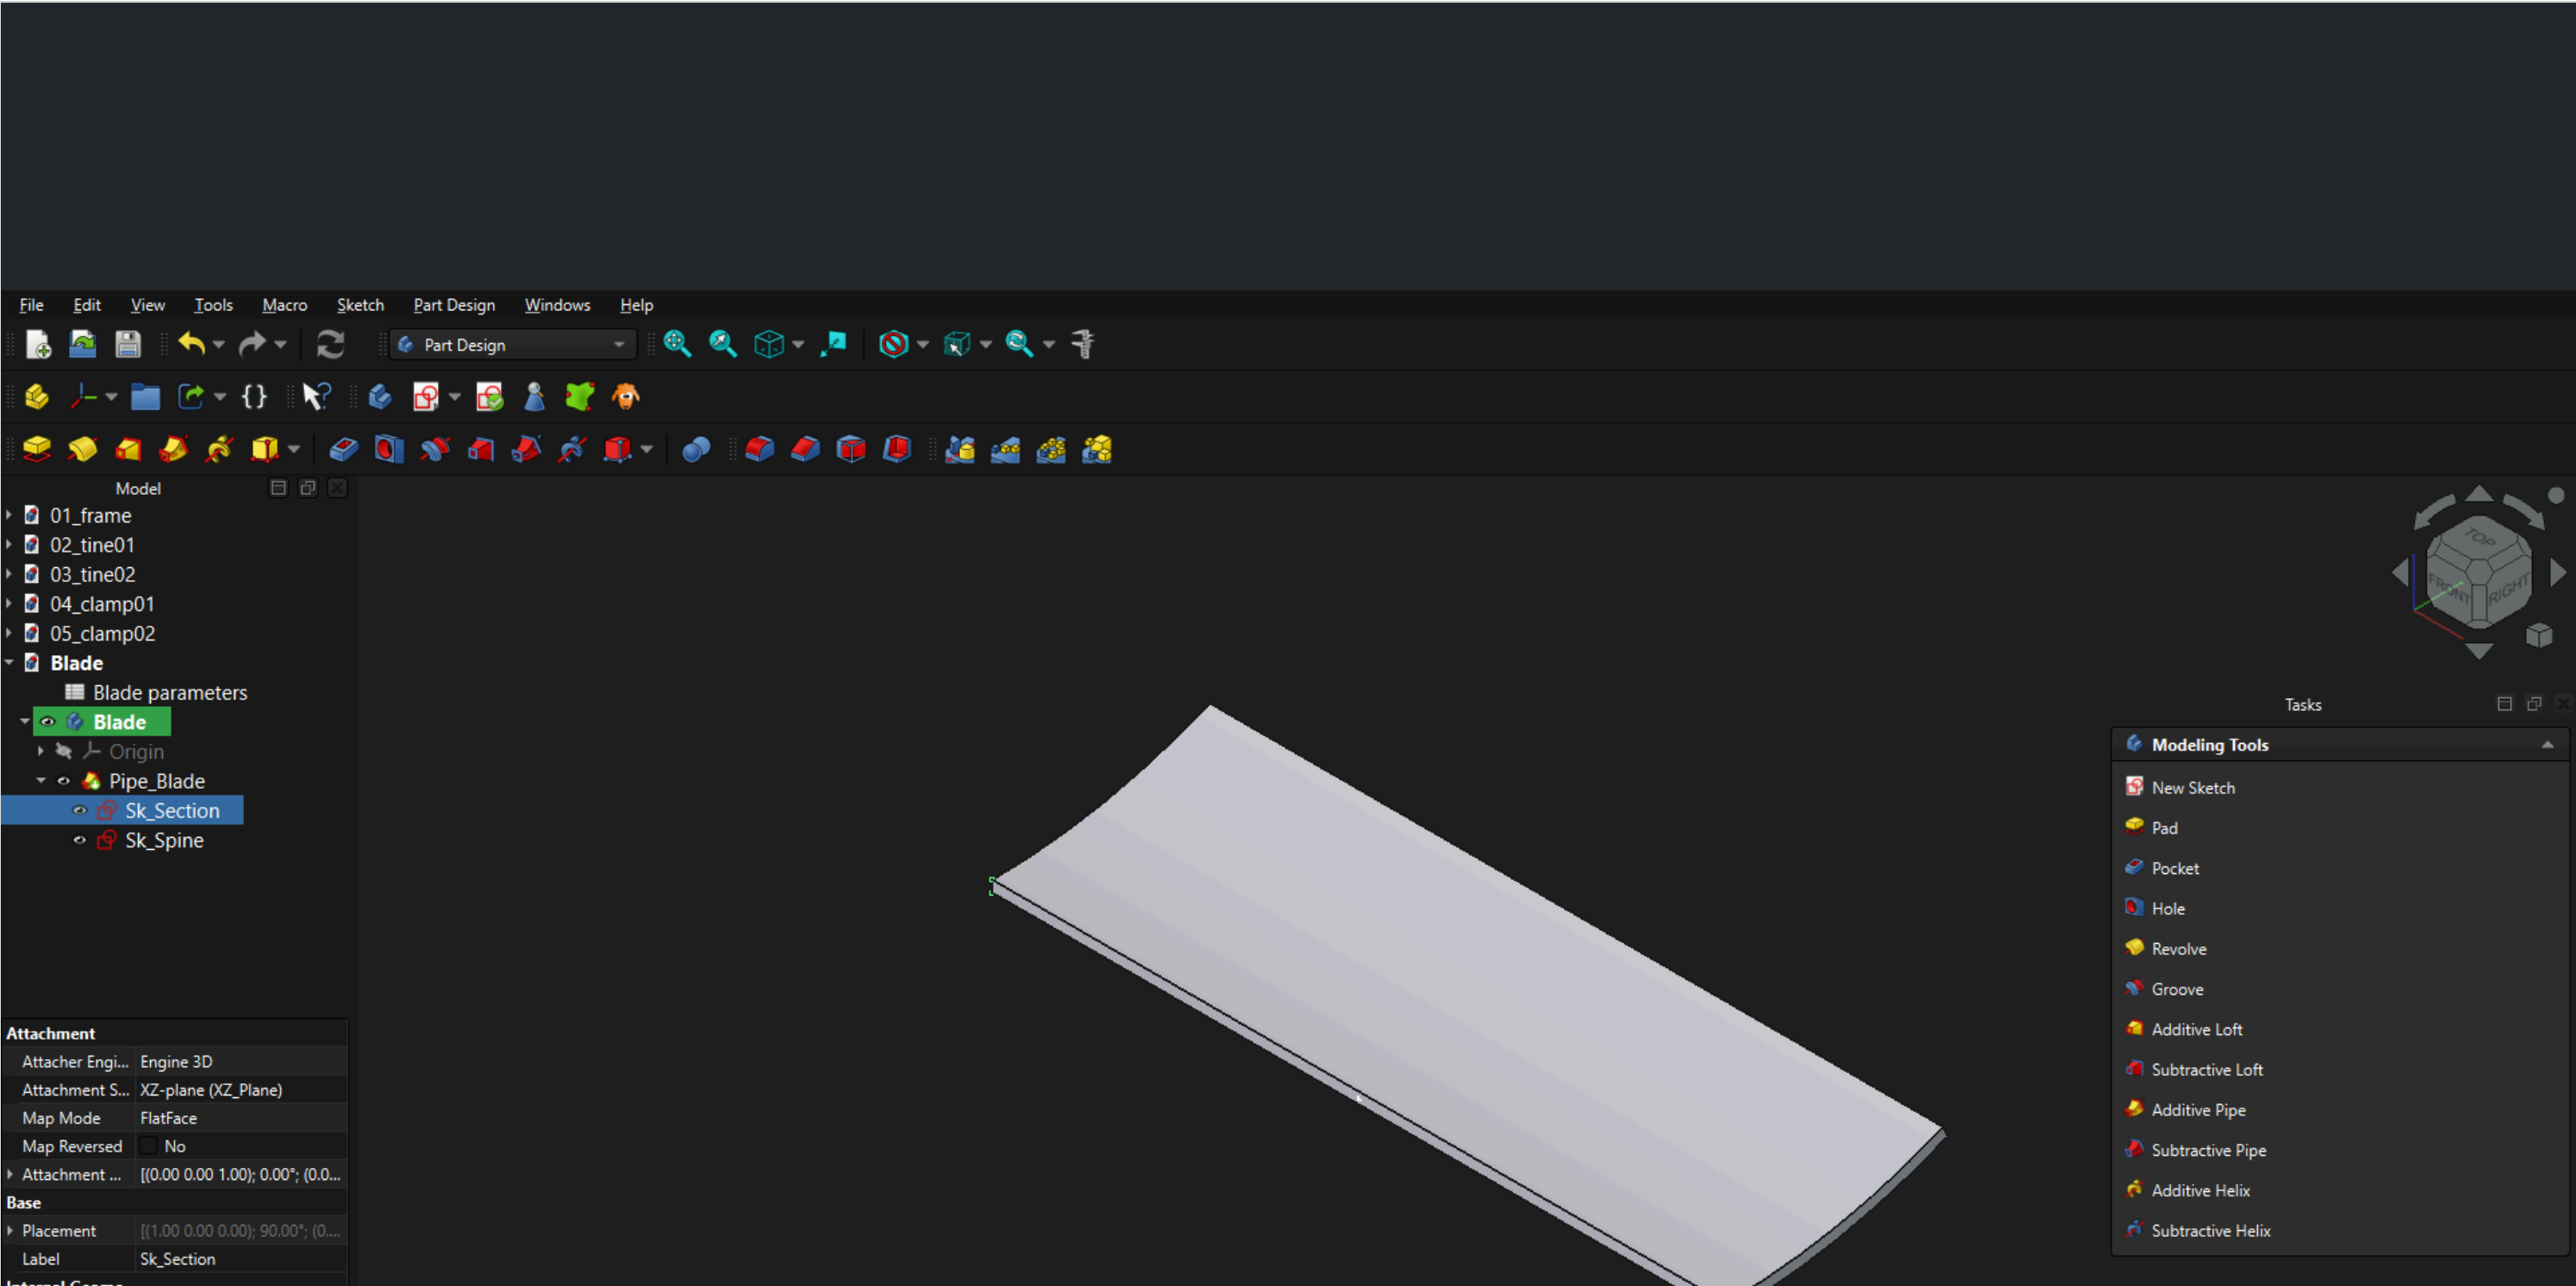

- Build the blade **already curved**.
- Draw an arc of the radius we want, and sweep the blade's cross-section along it.
- Then cut the plan shape out of the curved plate.

This is not a workaround. It is the better model. The bend radius becomes a number you can name and change, instead of an operation applied afterwards.

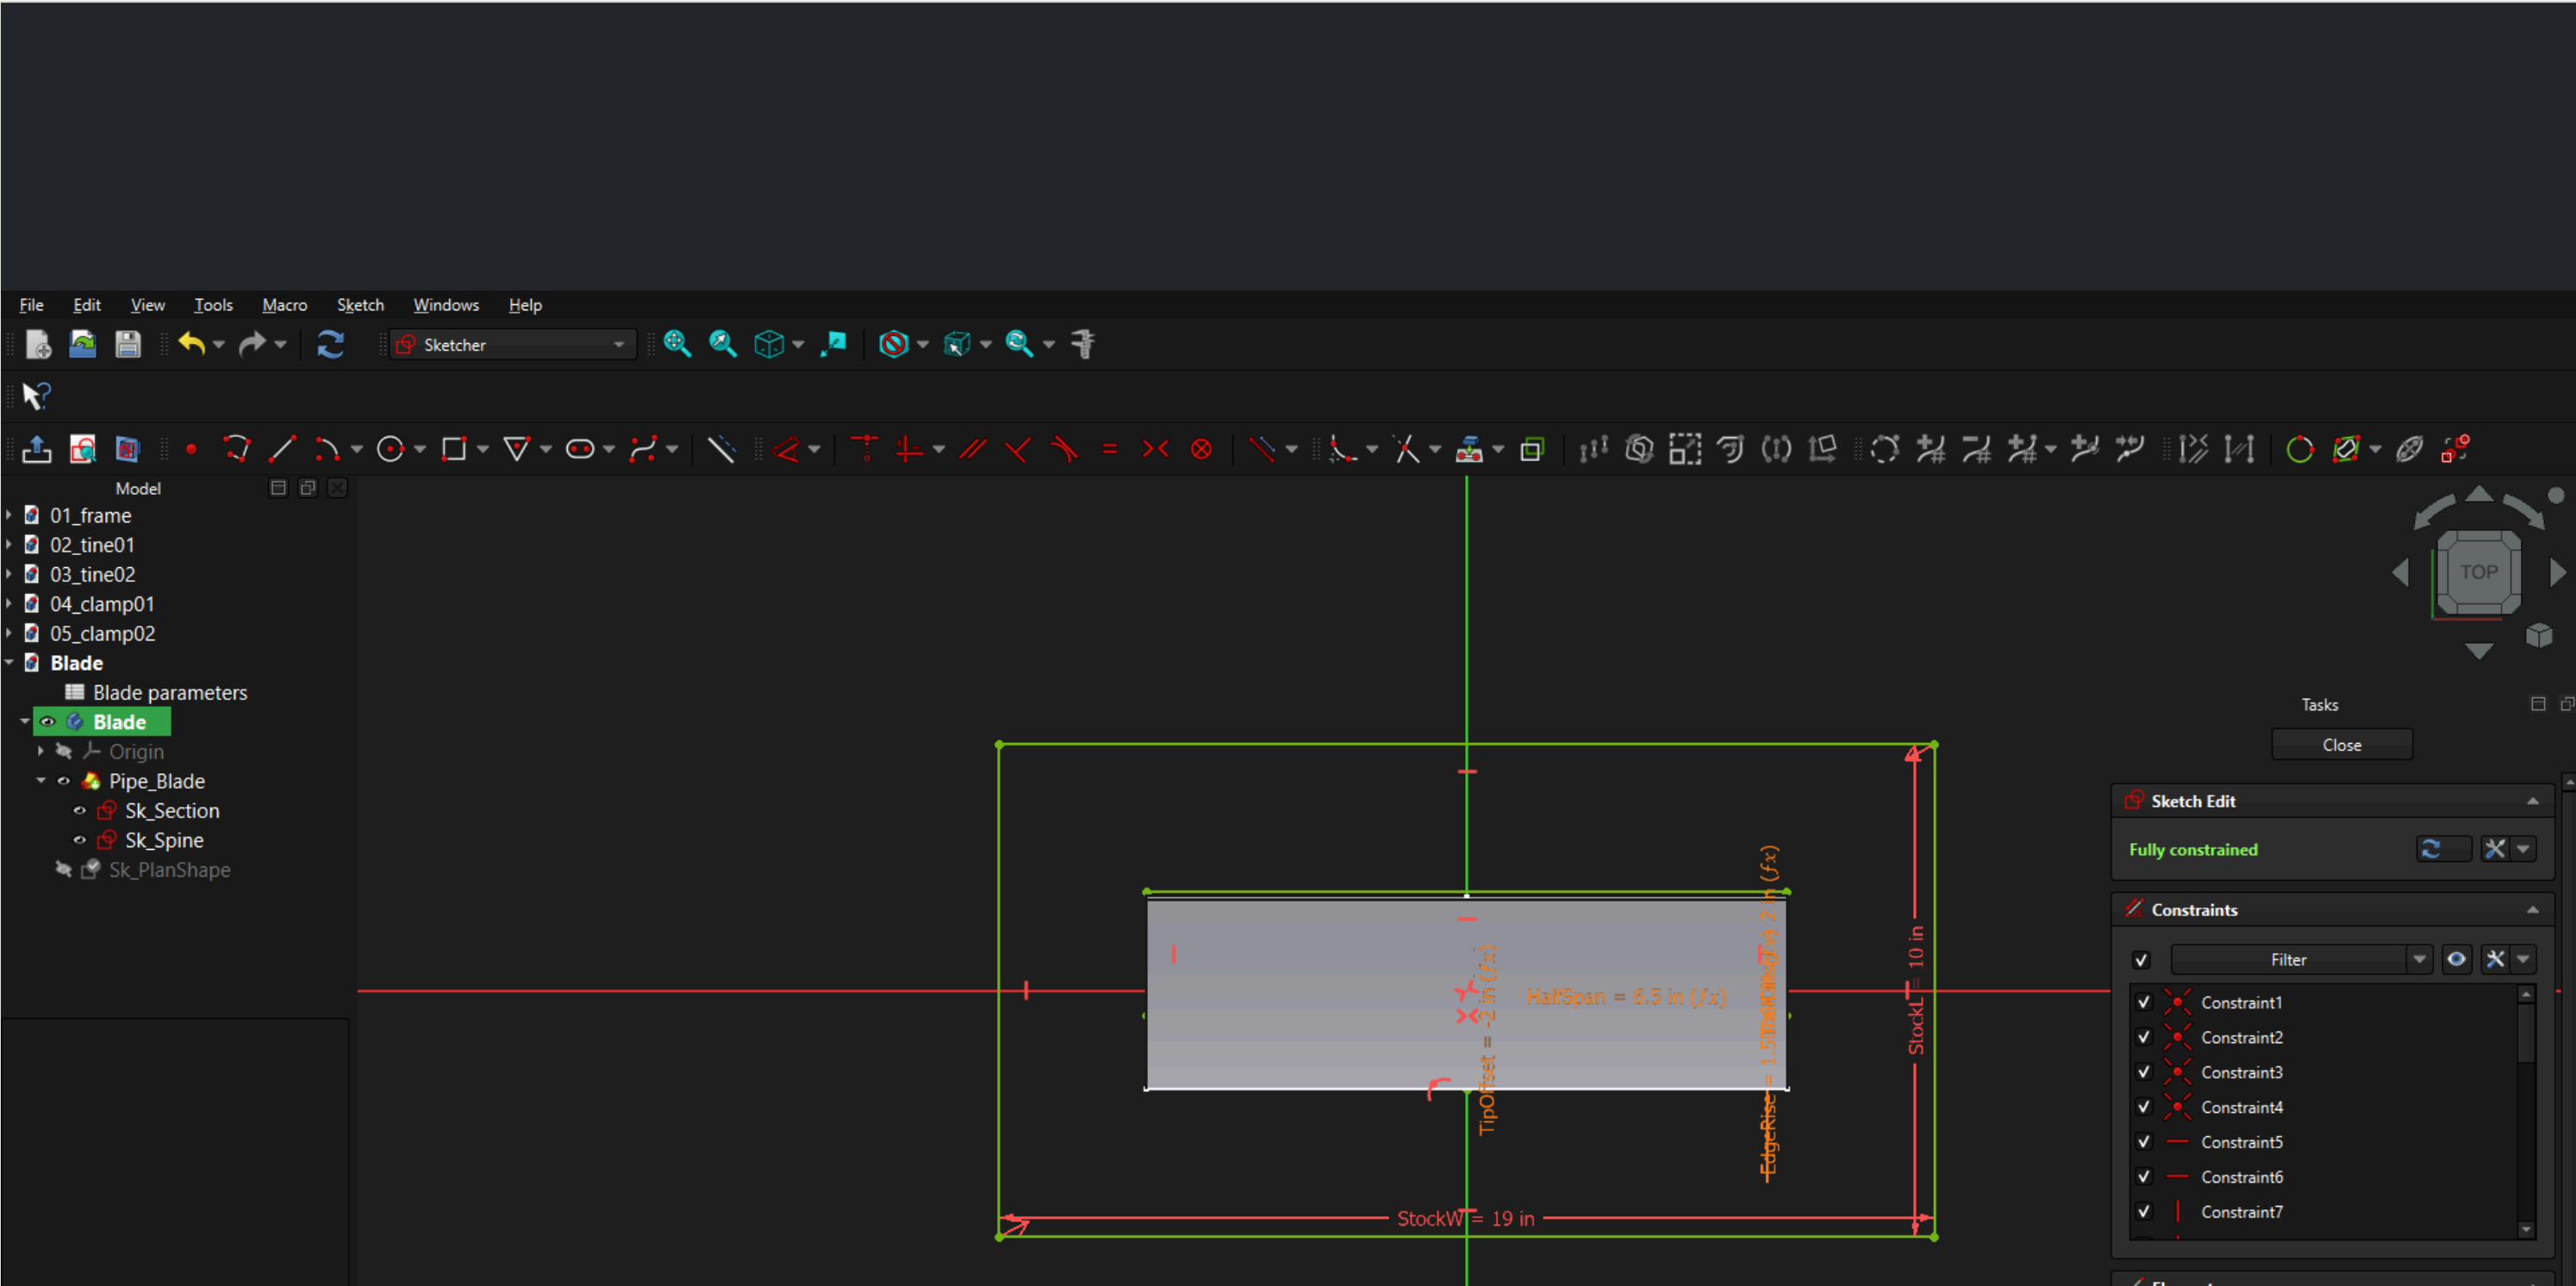

The arc the blade is bent on

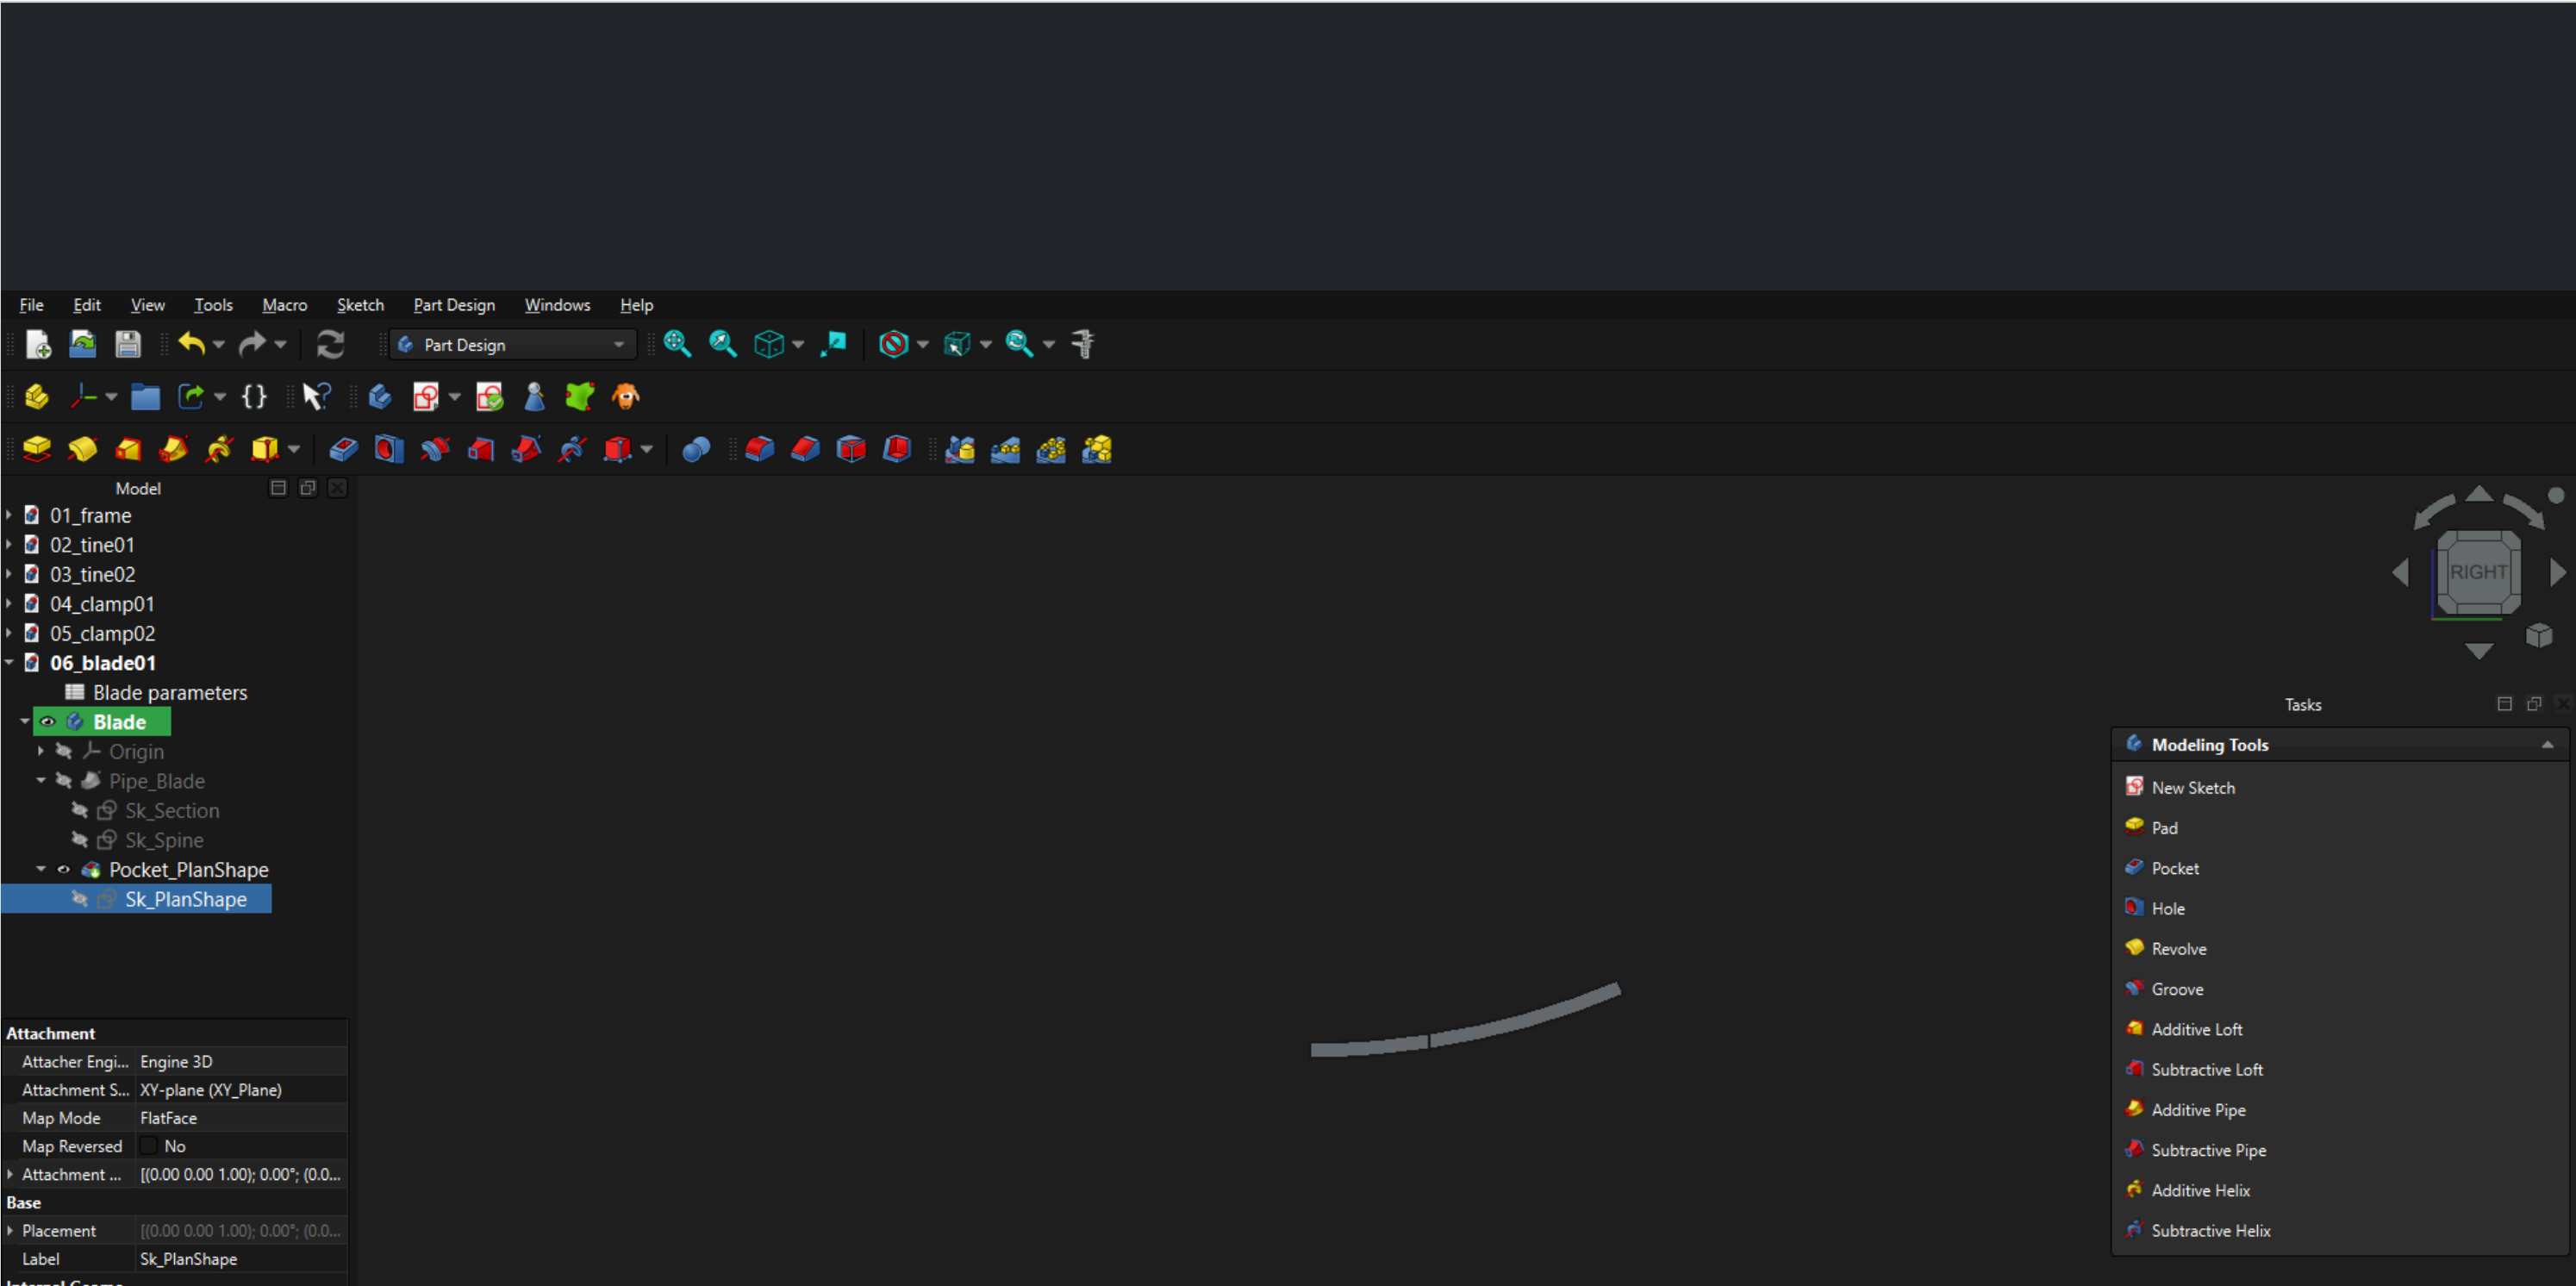

Sweep the section along it

Cutting the duckfoot shape

Blade 02 is one number

What we left out
