

The Assembly

Two ways to assemble

JOINTS

- You pick a face on one part and a face on another, and FreeCAD holds them together.
- This is what SolidWorks calls a mate.
- Good for anything that has to line up, or move.

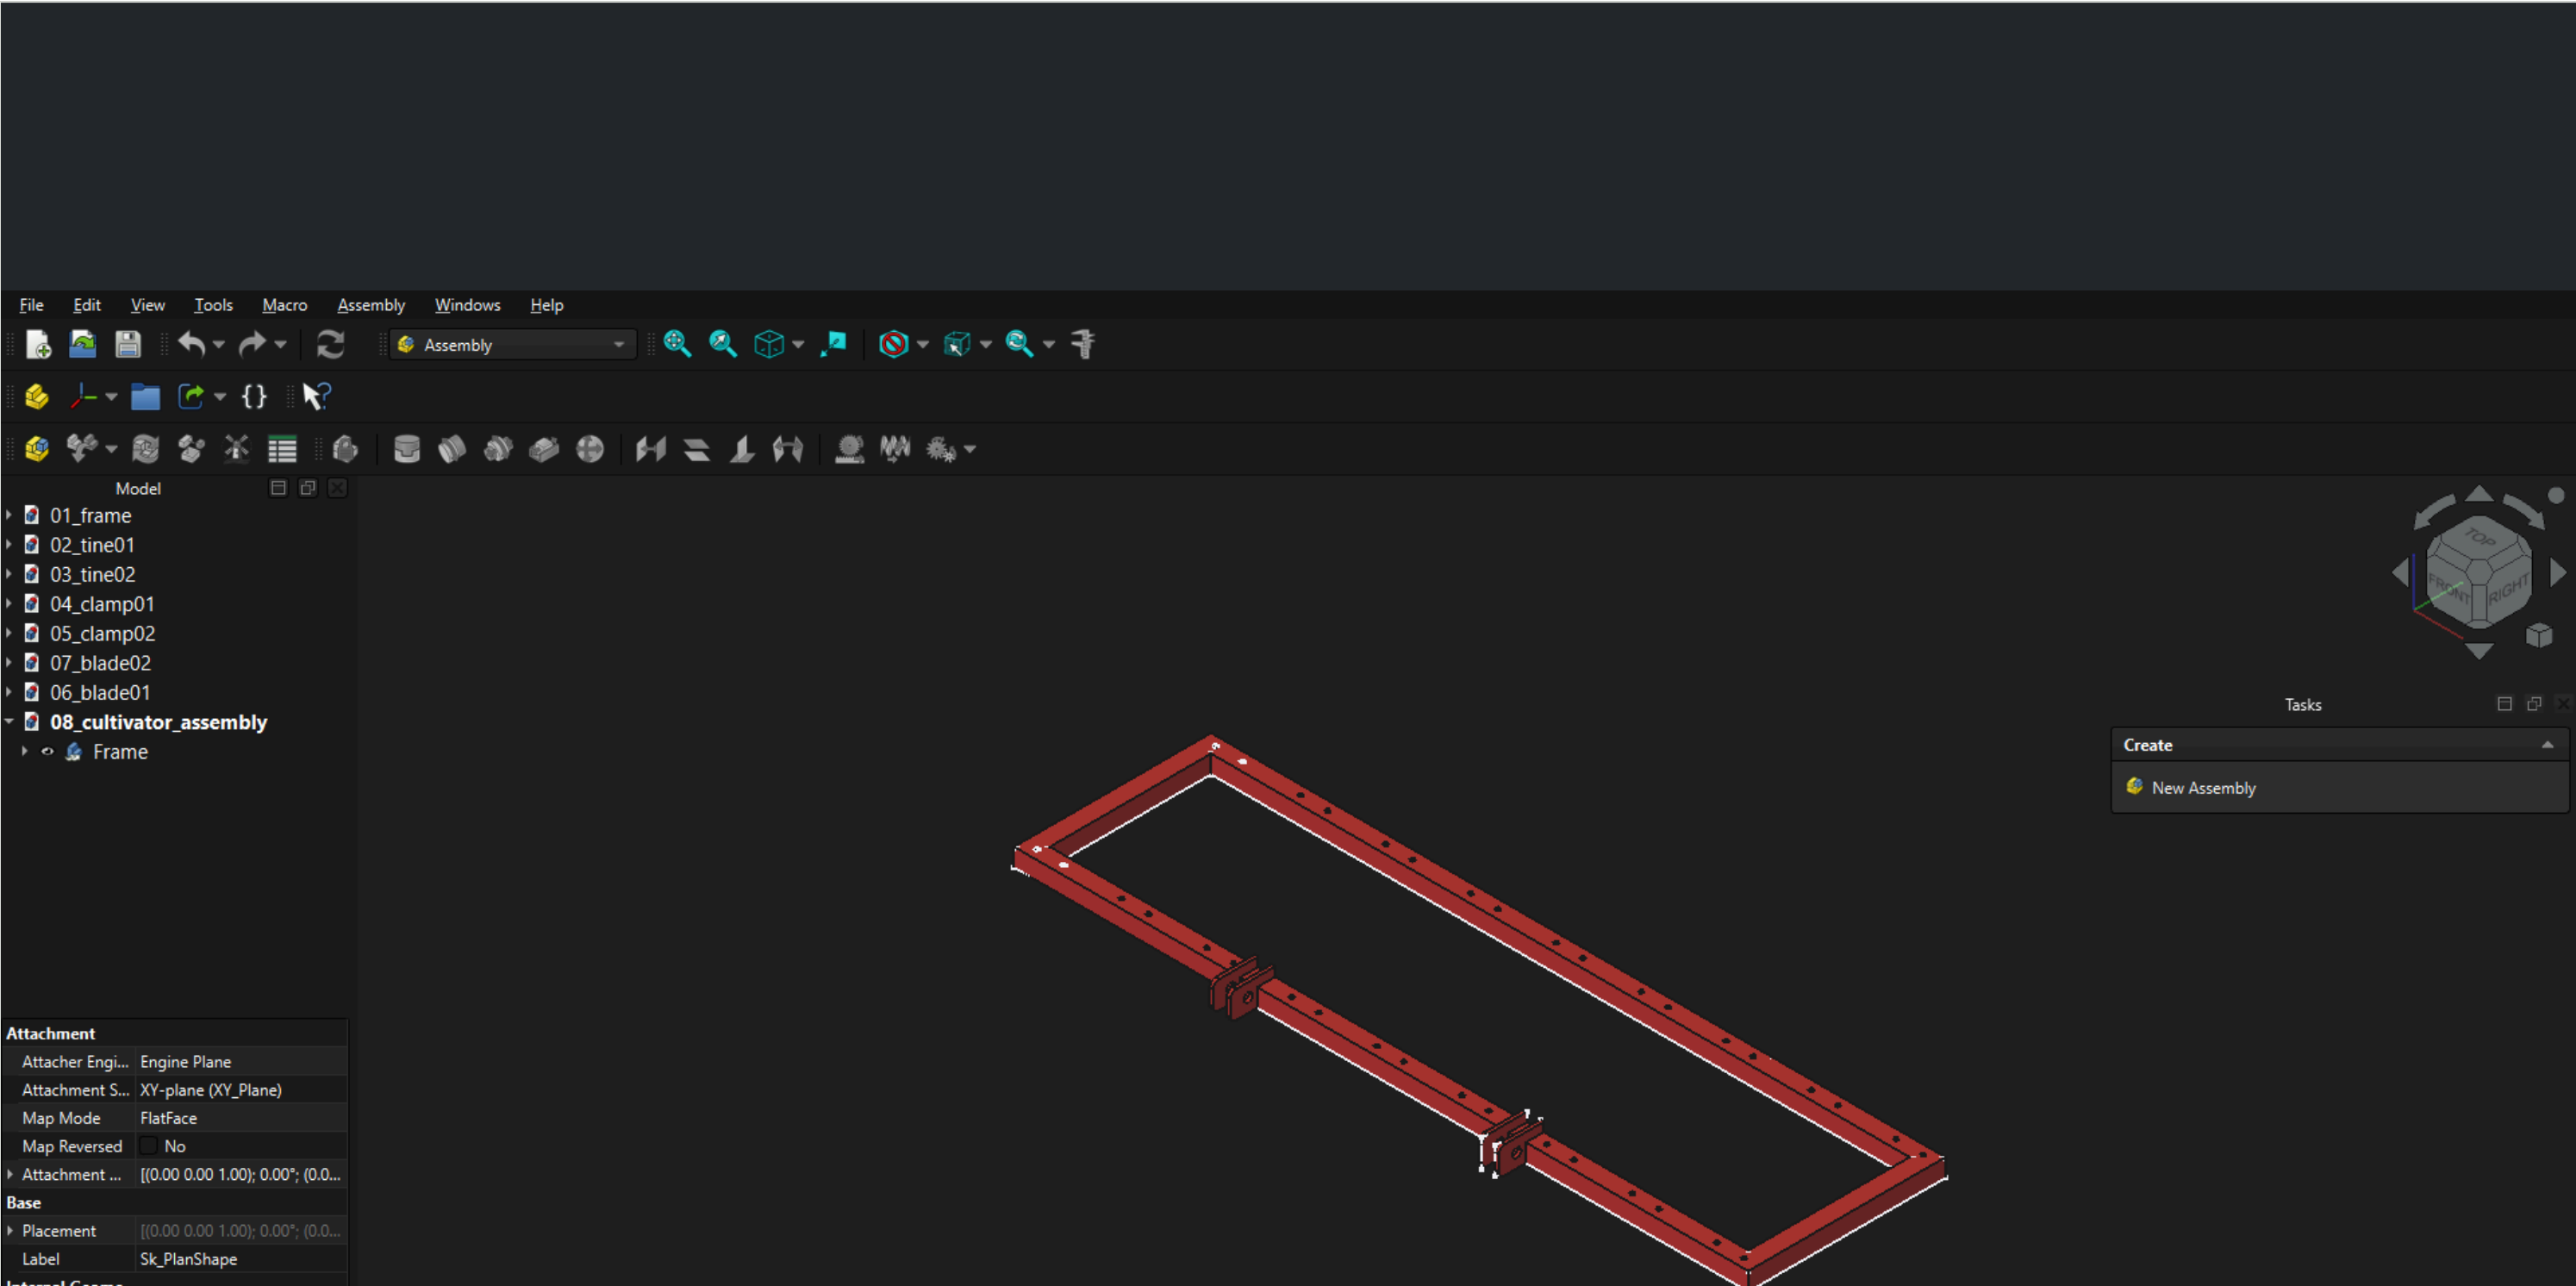

LINKS

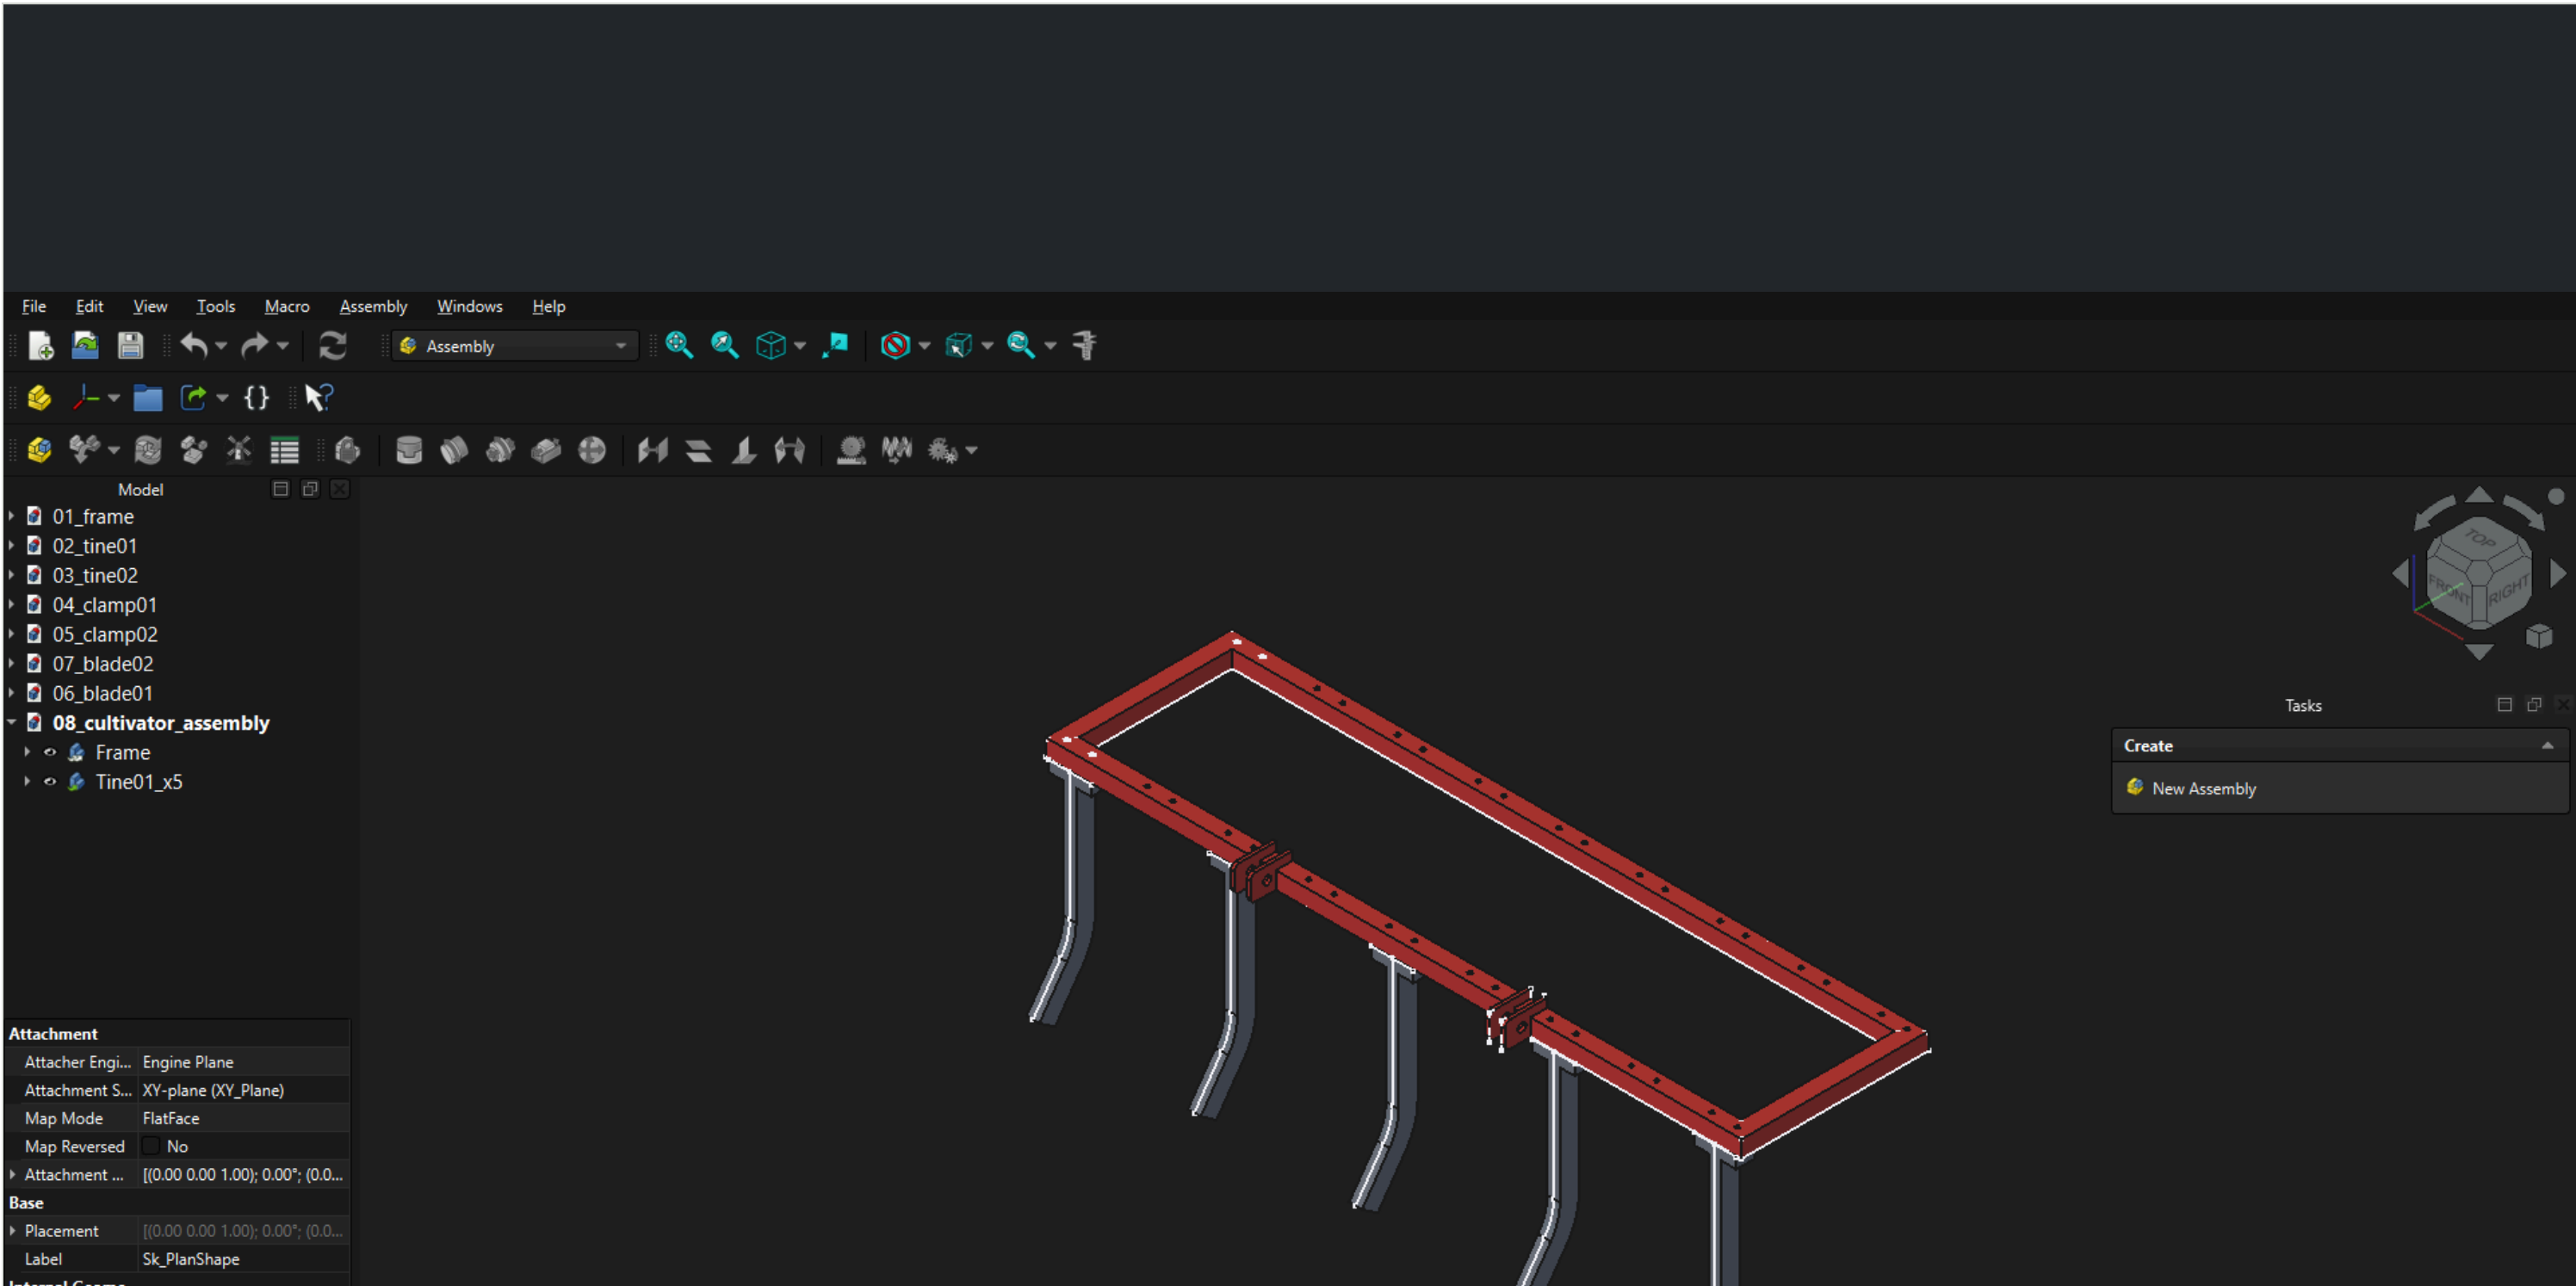

- You place a copy of a part at a position you give it.
- One link object can hold a whole list of positions.
- Good for repeated parts on a regular spacing.

Nine tynes on a regular pitch is exactly the second case. With joints that would be eighteen separate mates to create and keep in step.
