

Part 1: The Frame

What the tutorial gives us

WHAT IT SAYS

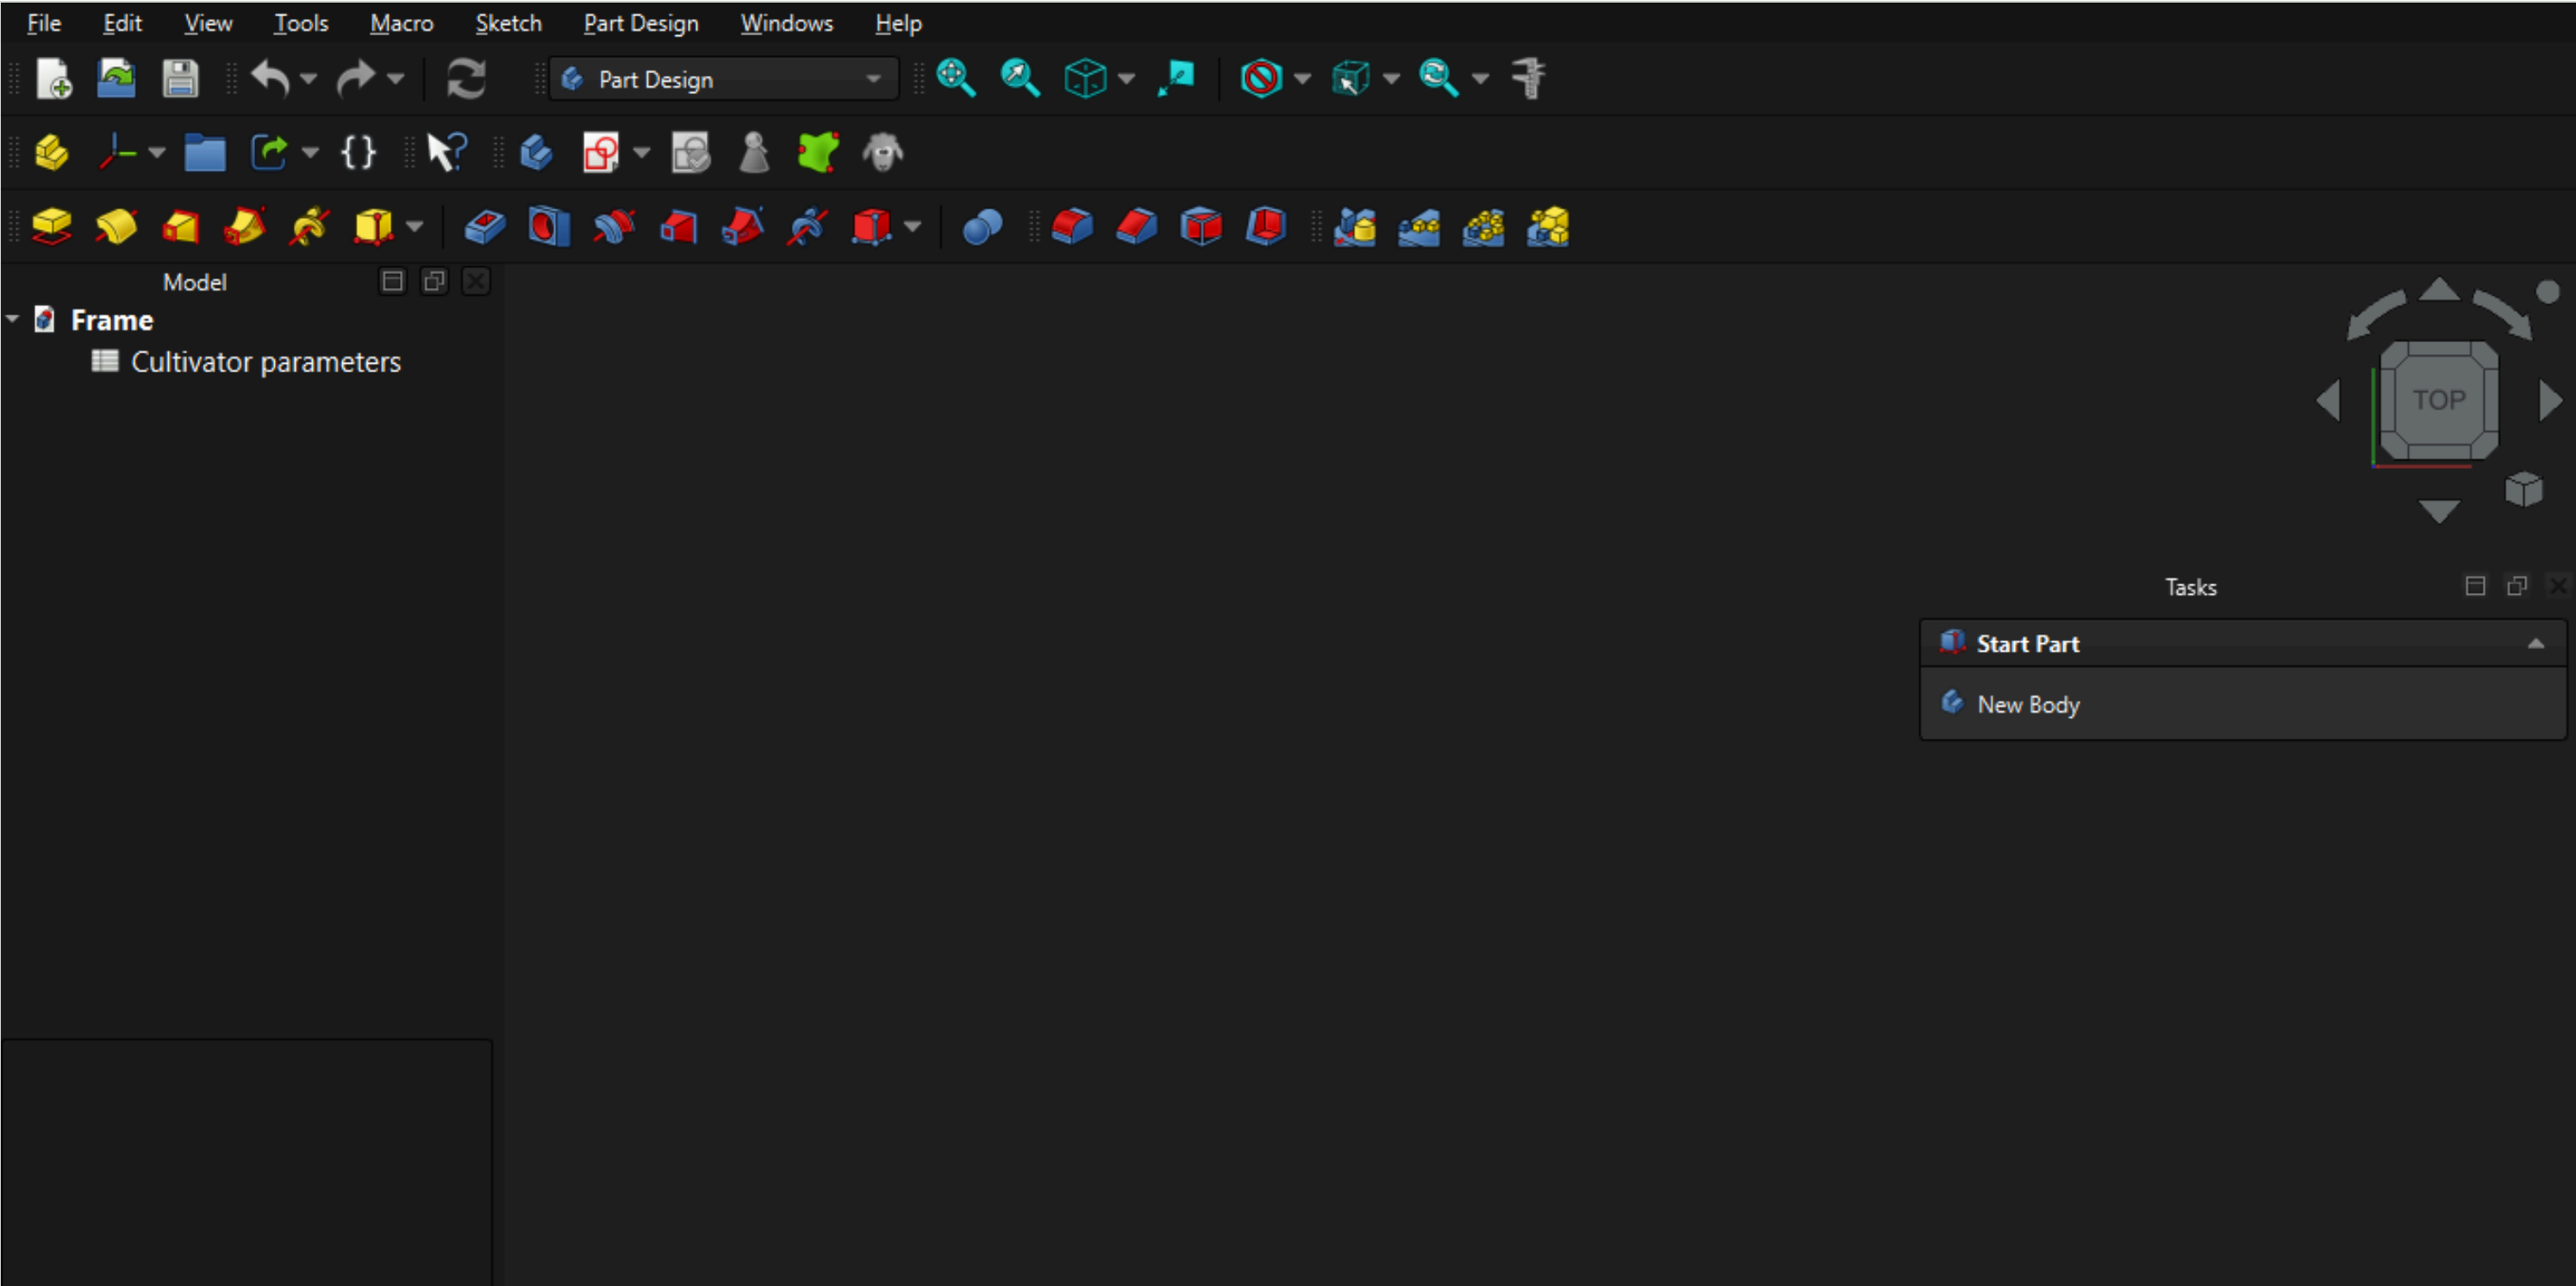

- “A centre rectangle, 82 inches and a height of 22 inches”
- “Square tube, size 0.1875”
- “One hole here and another hole here”
- “The hole size is 3 inches”
- “The distance is 9.5 inches, we need 9 patterns”

WHAT WE MAKE OF IT

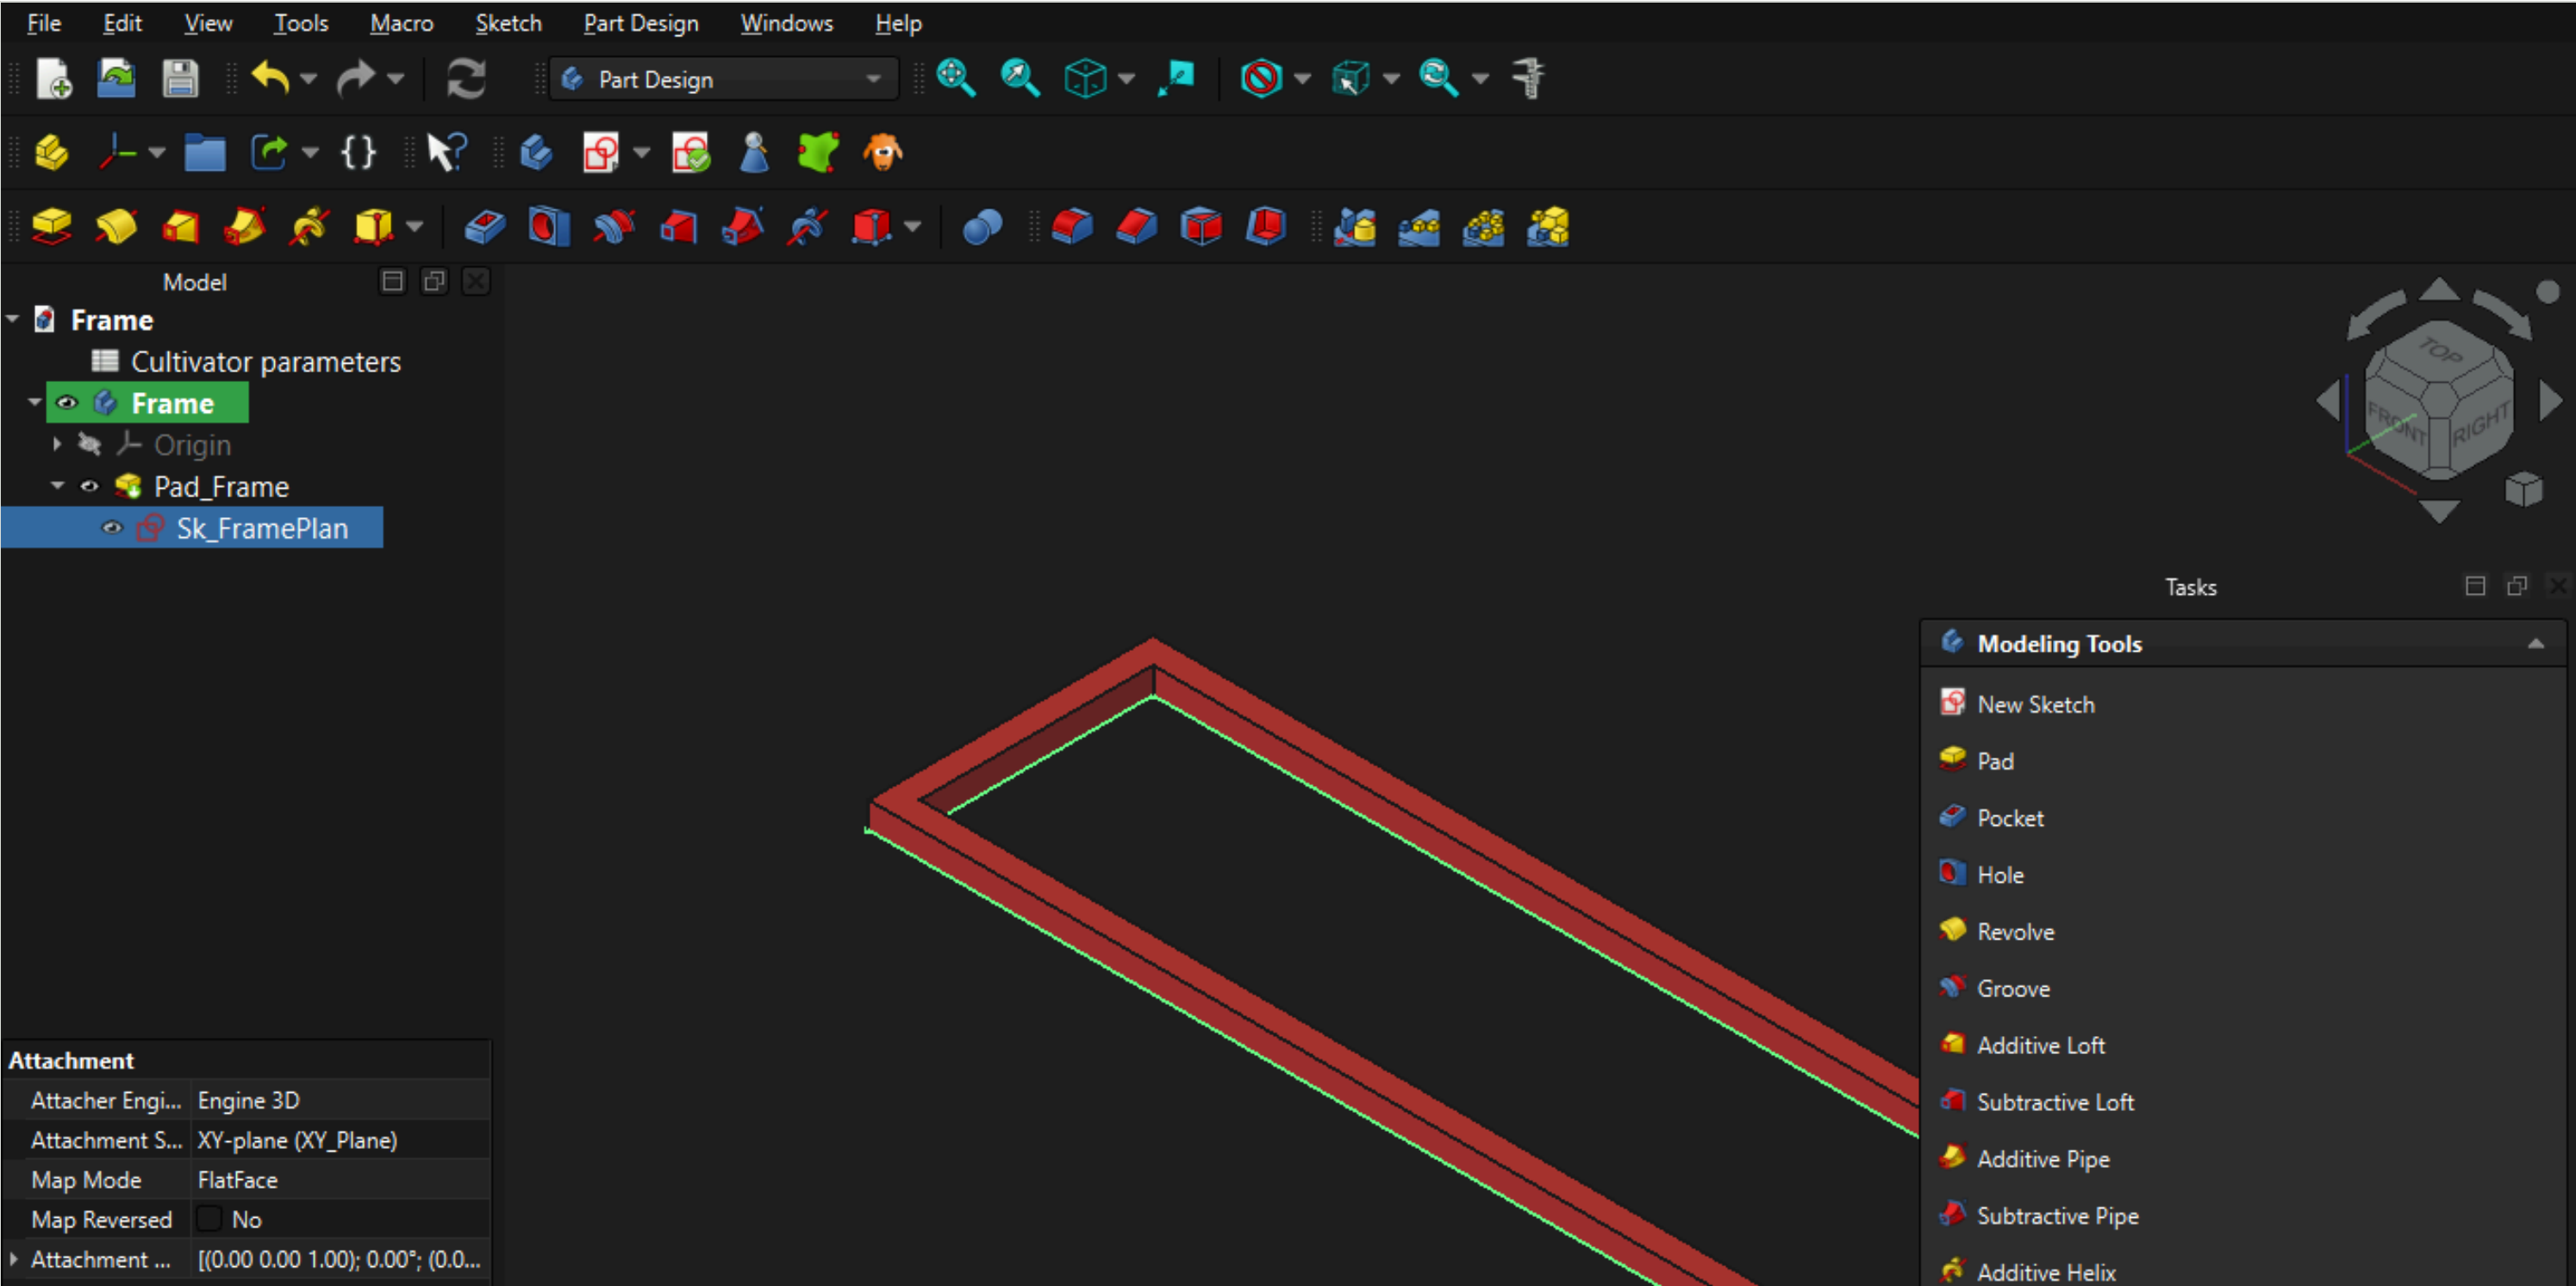

- **Each station is a pair of holes**, 3 inches apart. The 3 inches is the spacing, not a diameter.
- The tyne, later in the same video, gets two bolts 3 inches apart. They match, so the machine bolts together.
- **0.1875 is the wall thickness**, not the tube size. We use 2 × 2 inch tube, which is normal for a light cultivator.

The brackets at each end are the tractor's lower link points. A pair 15 inches out from the centre gives 30 inches between them, which is the standard spacing.

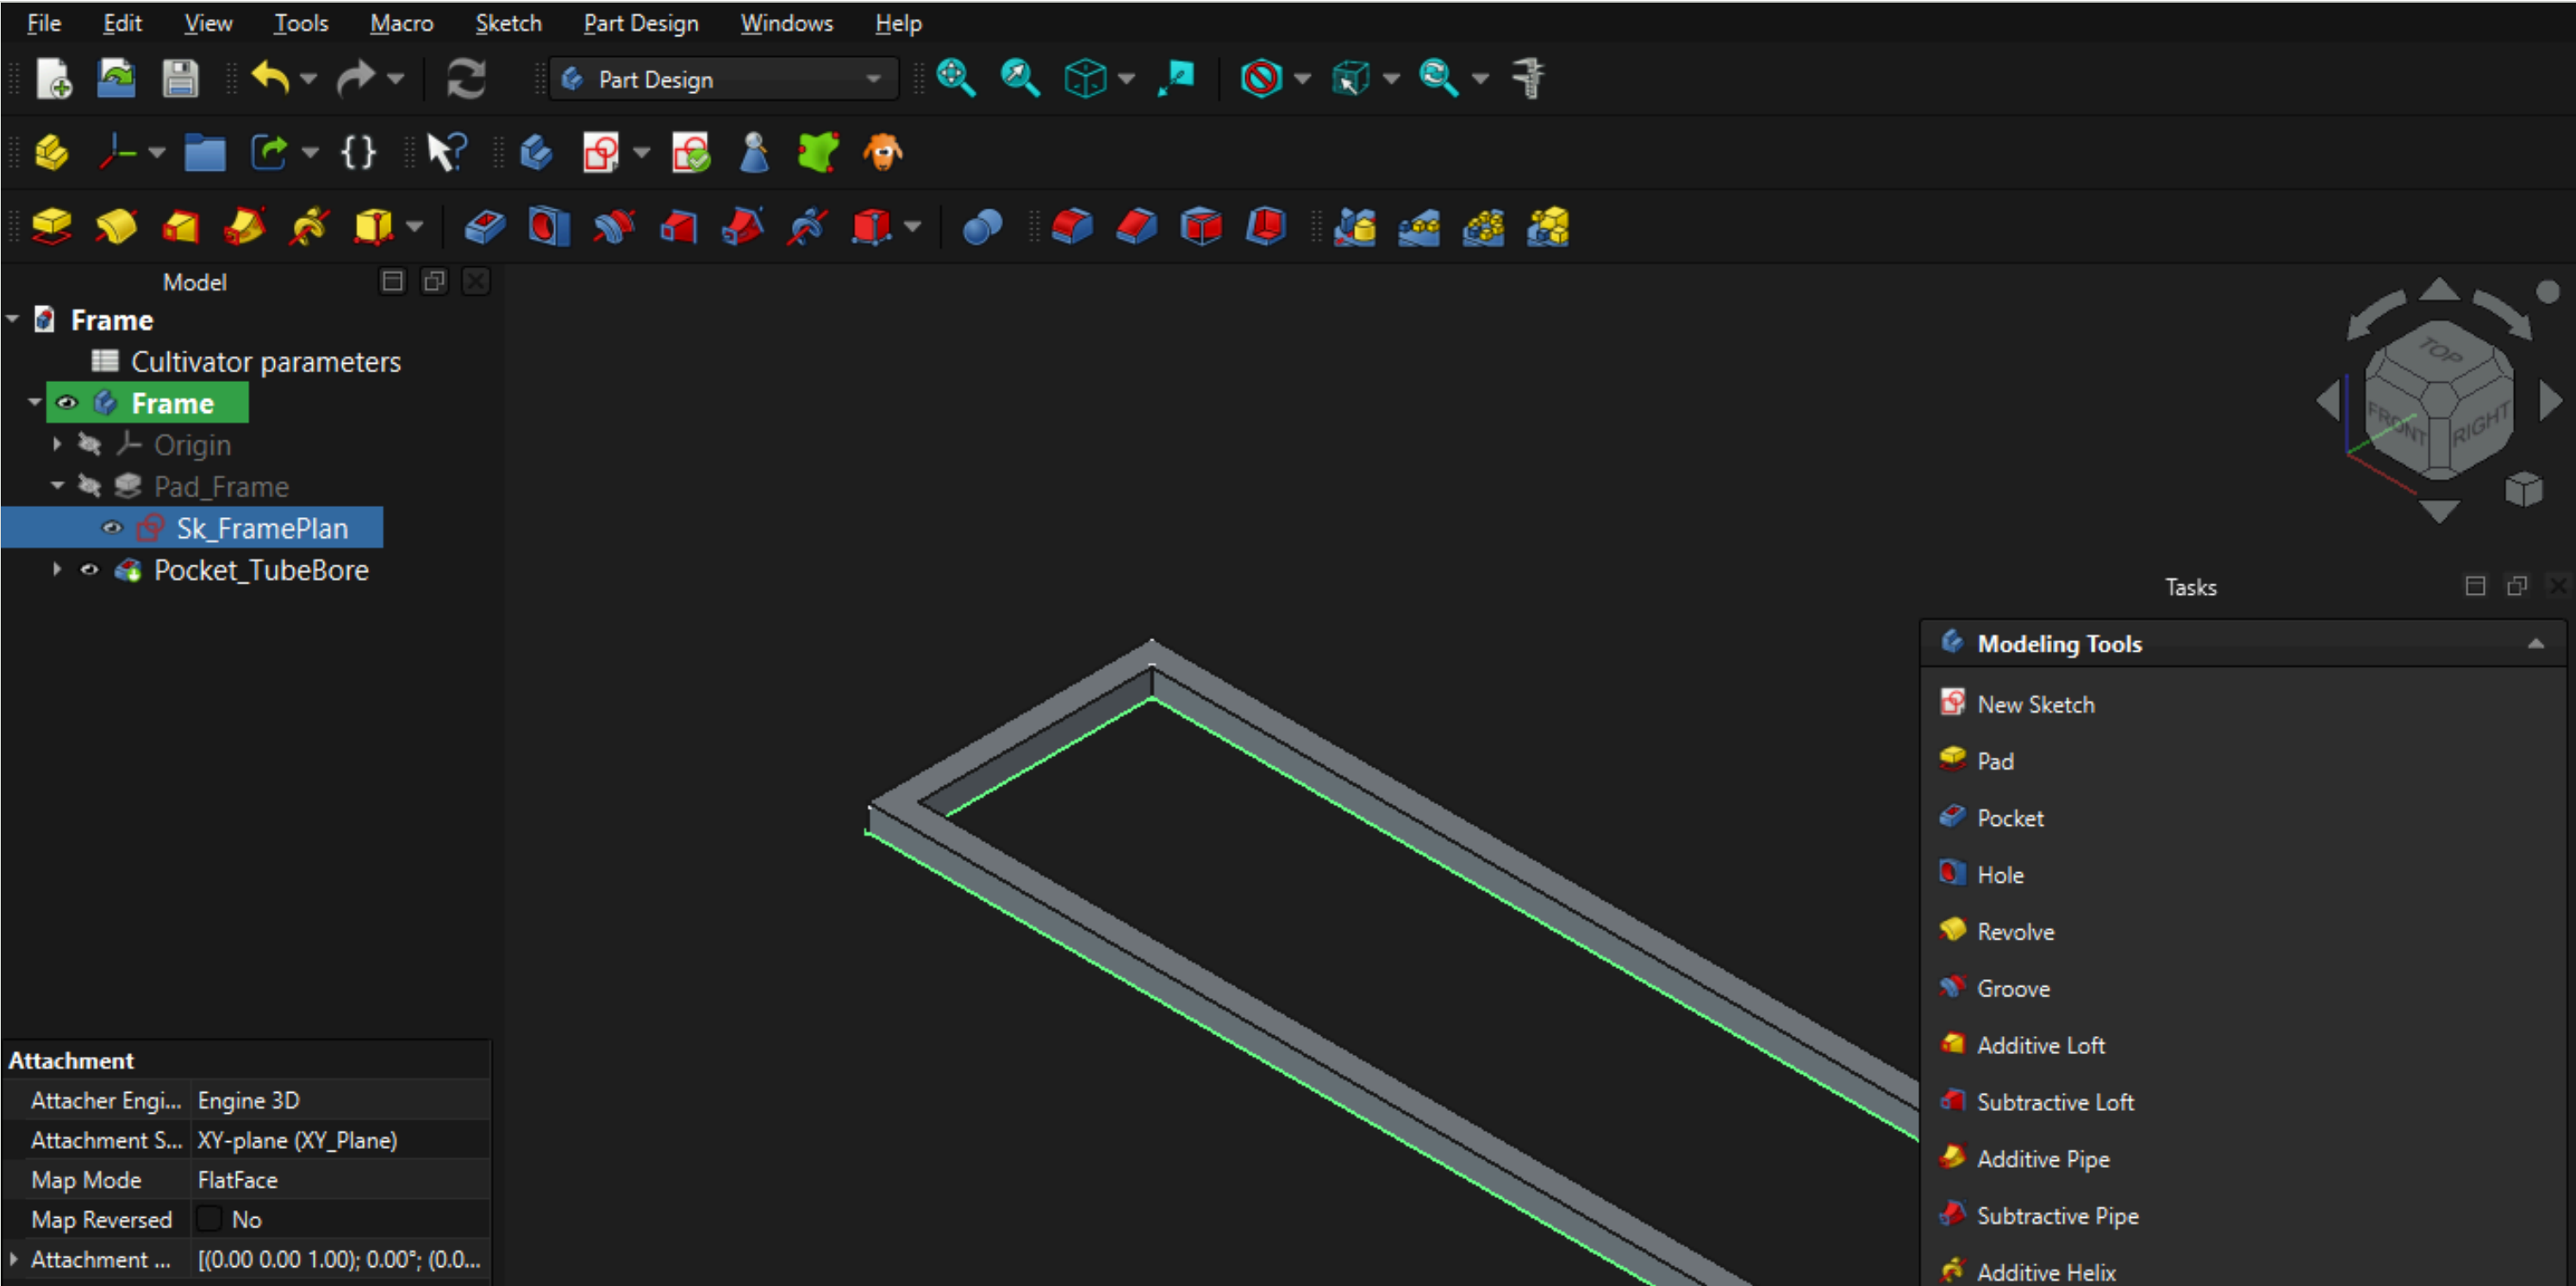

Put the numbers in a spreadsheet first

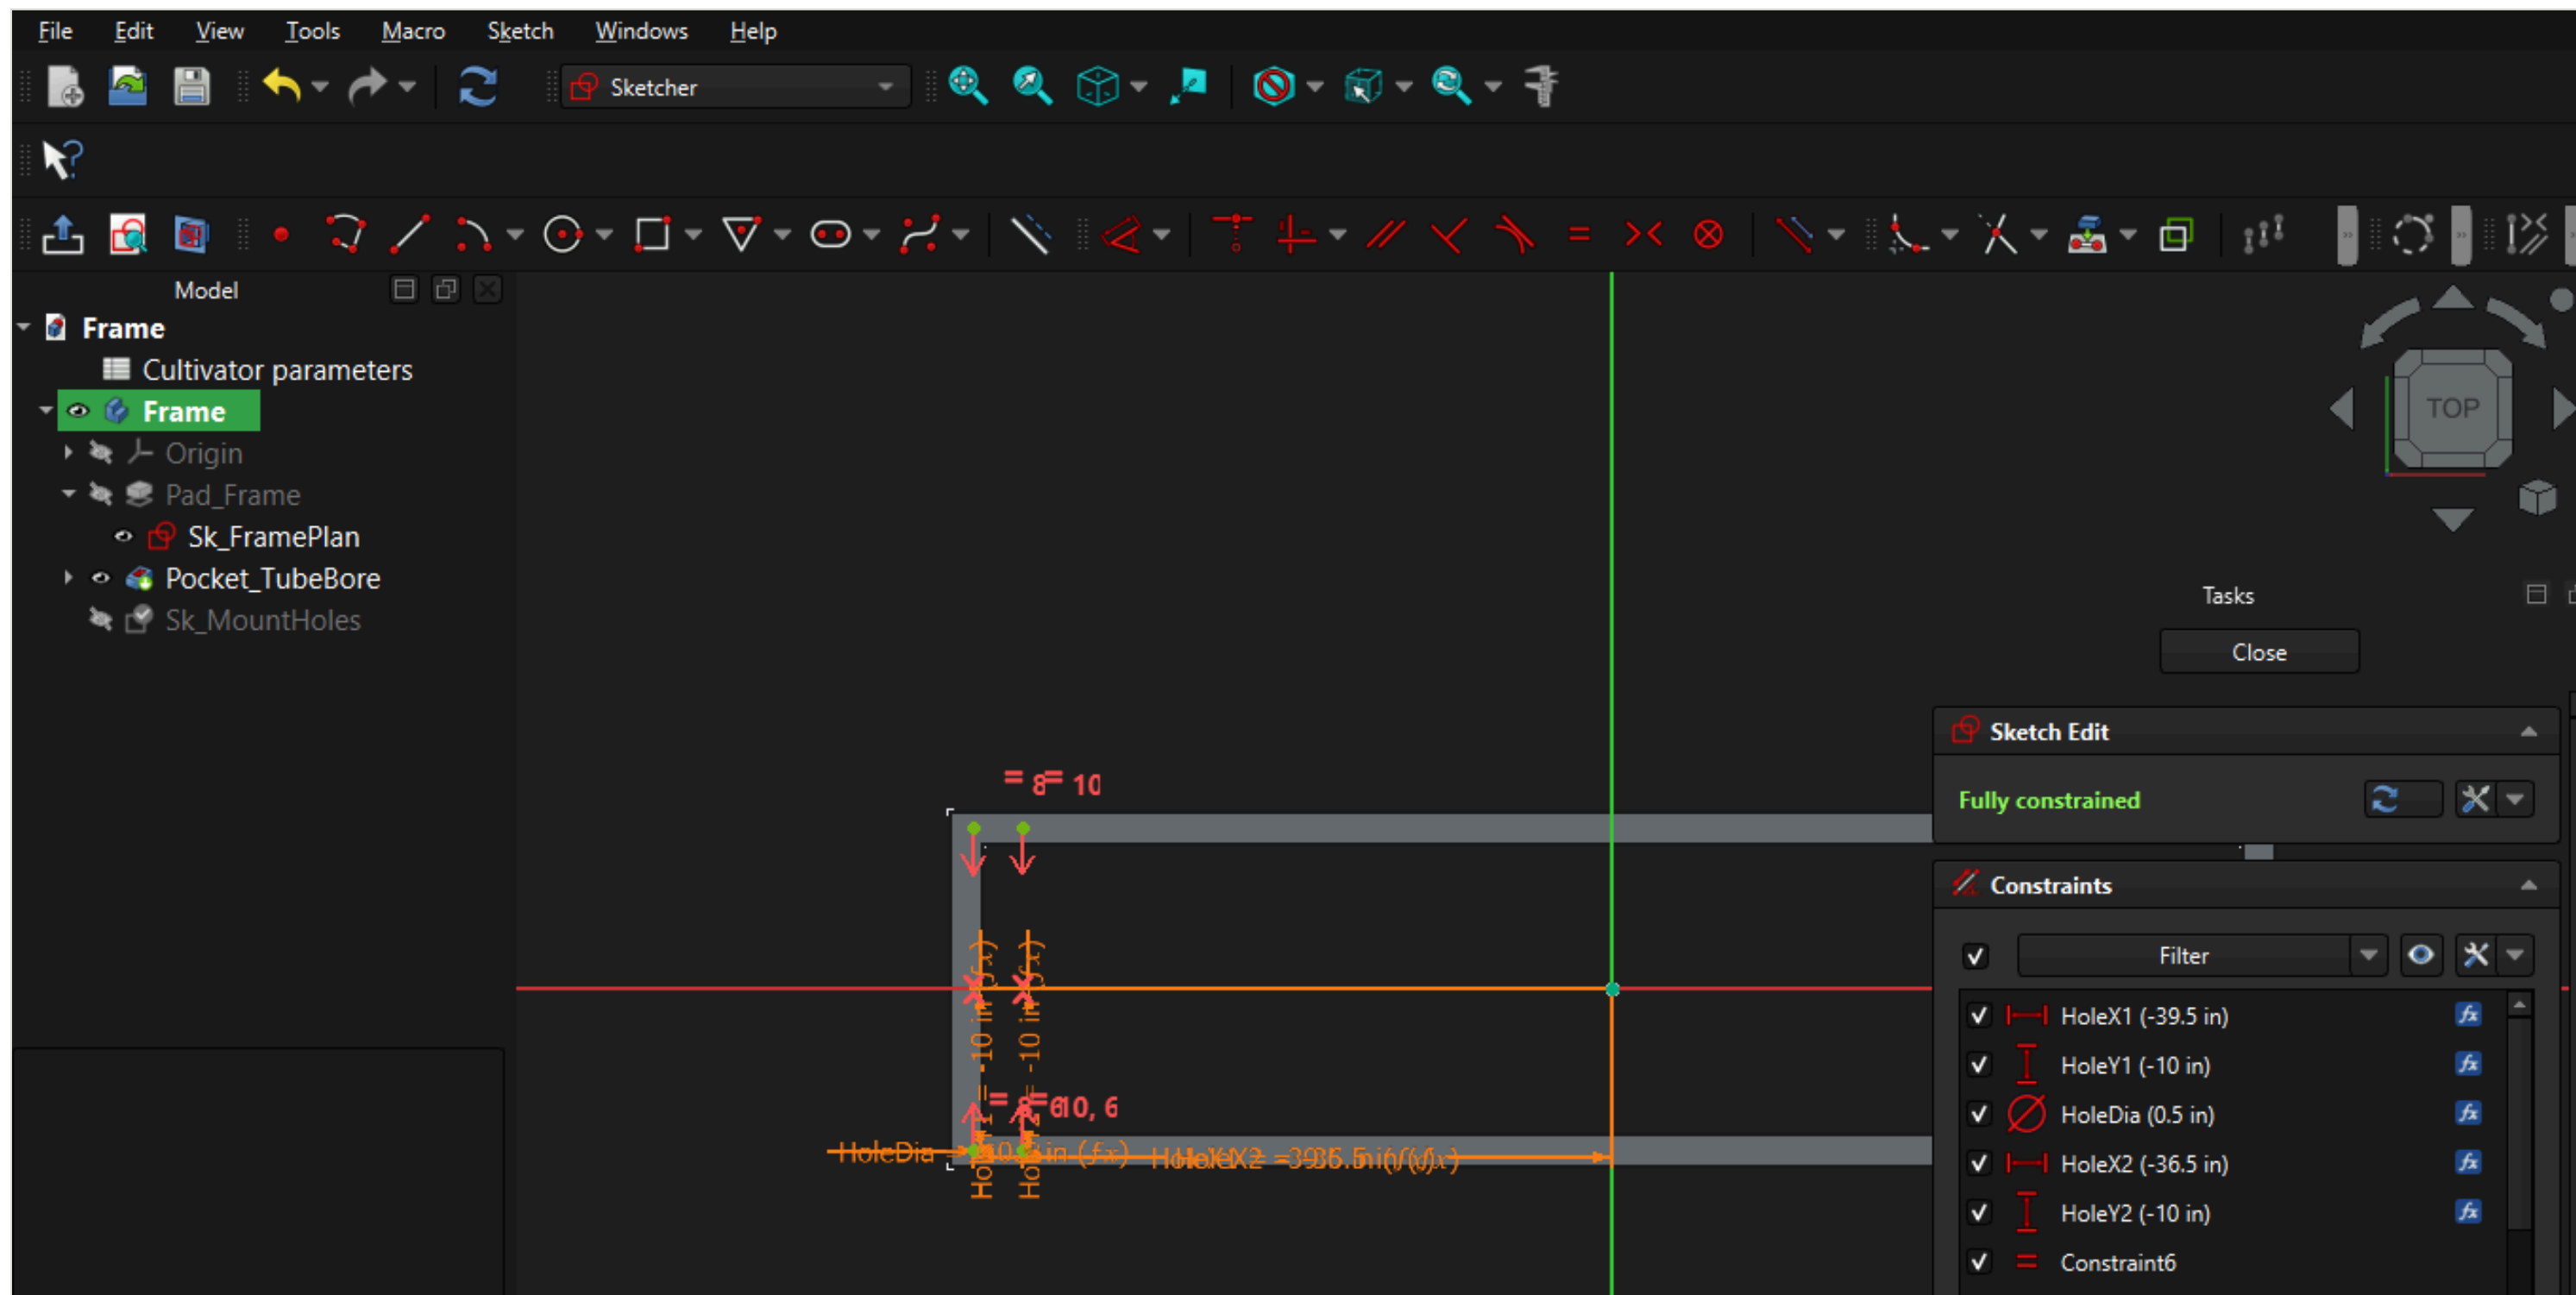

The outline: two rectangles

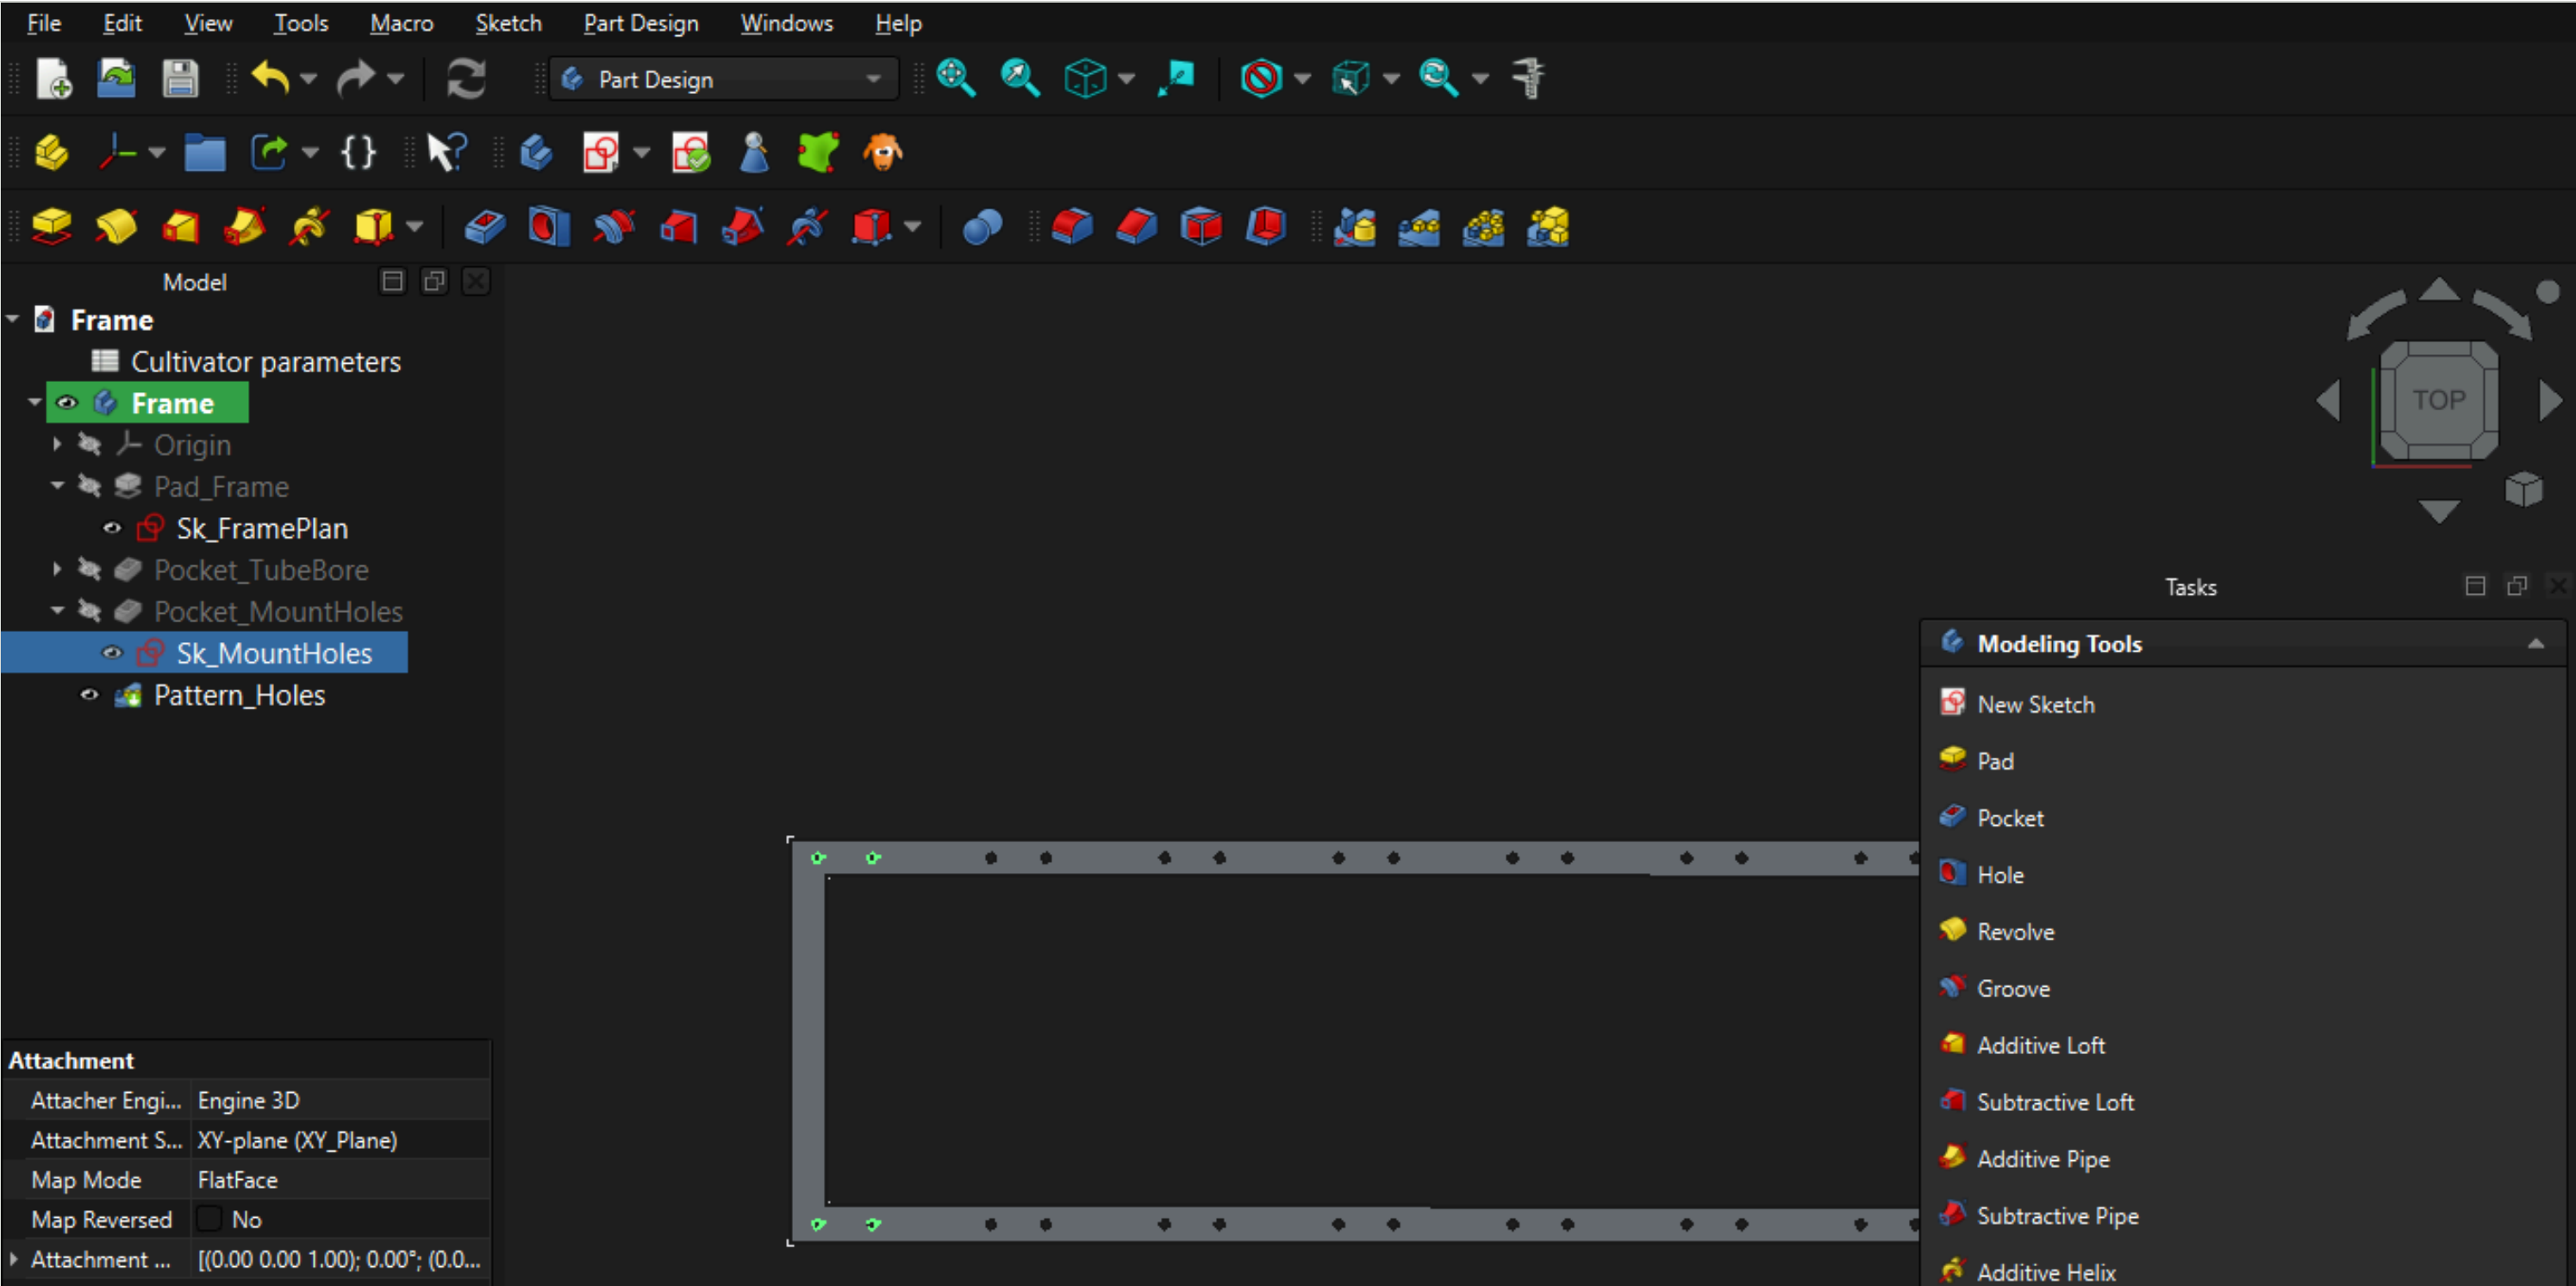

Making the tube hollow

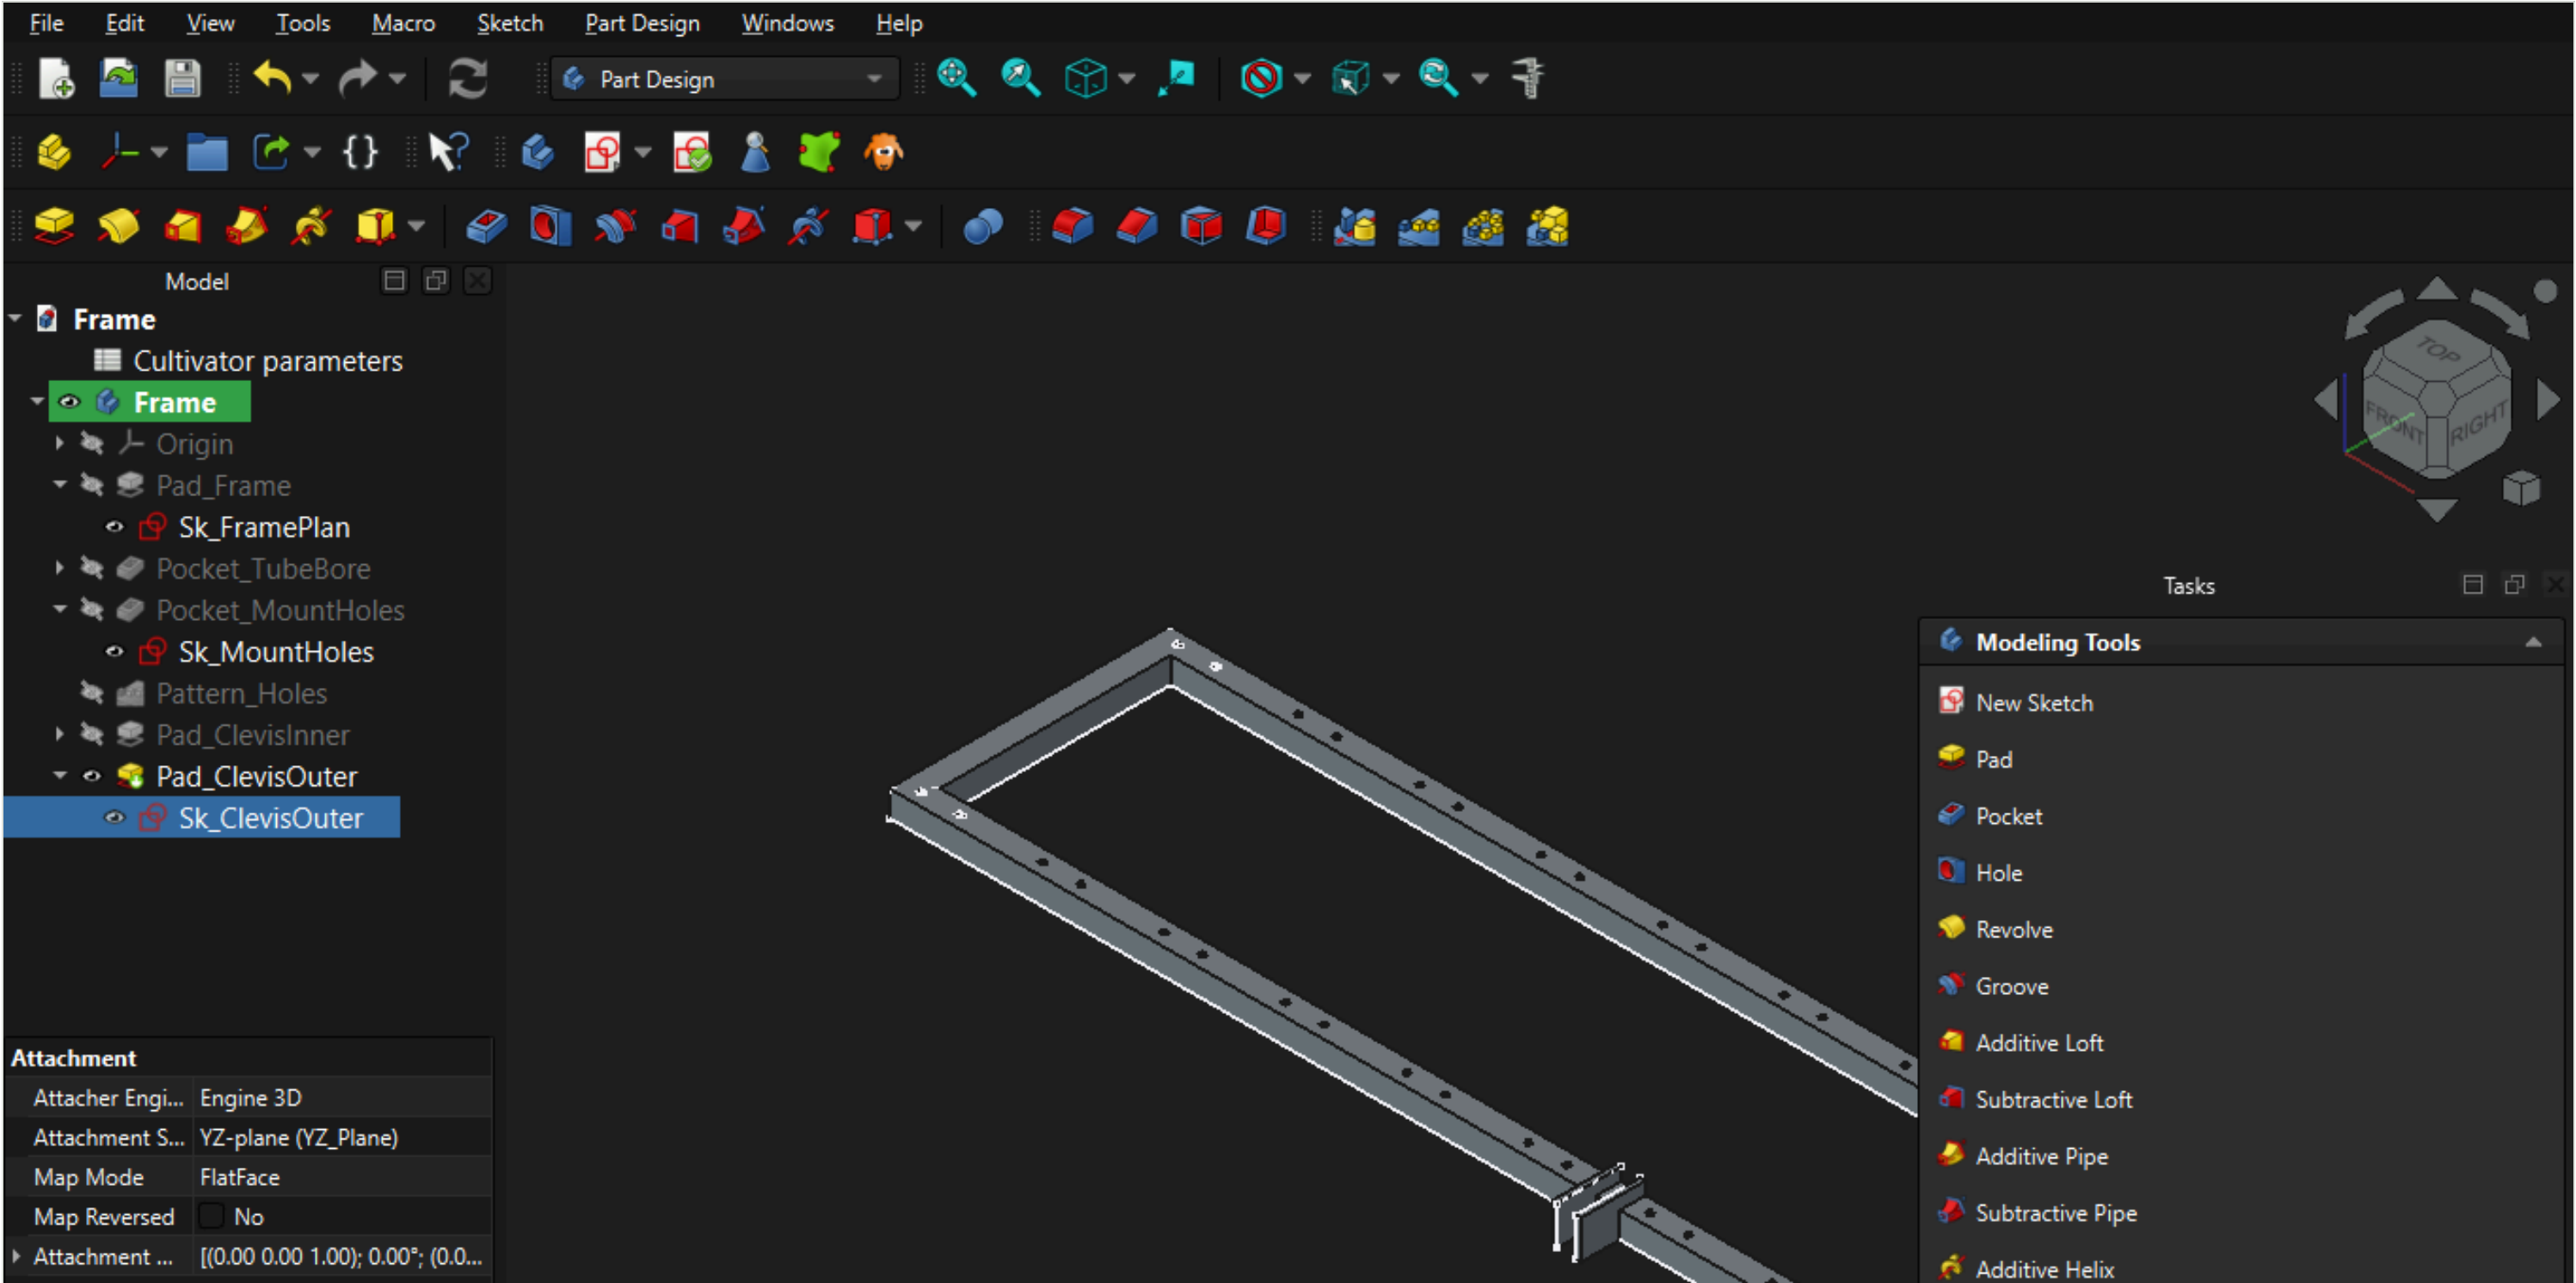

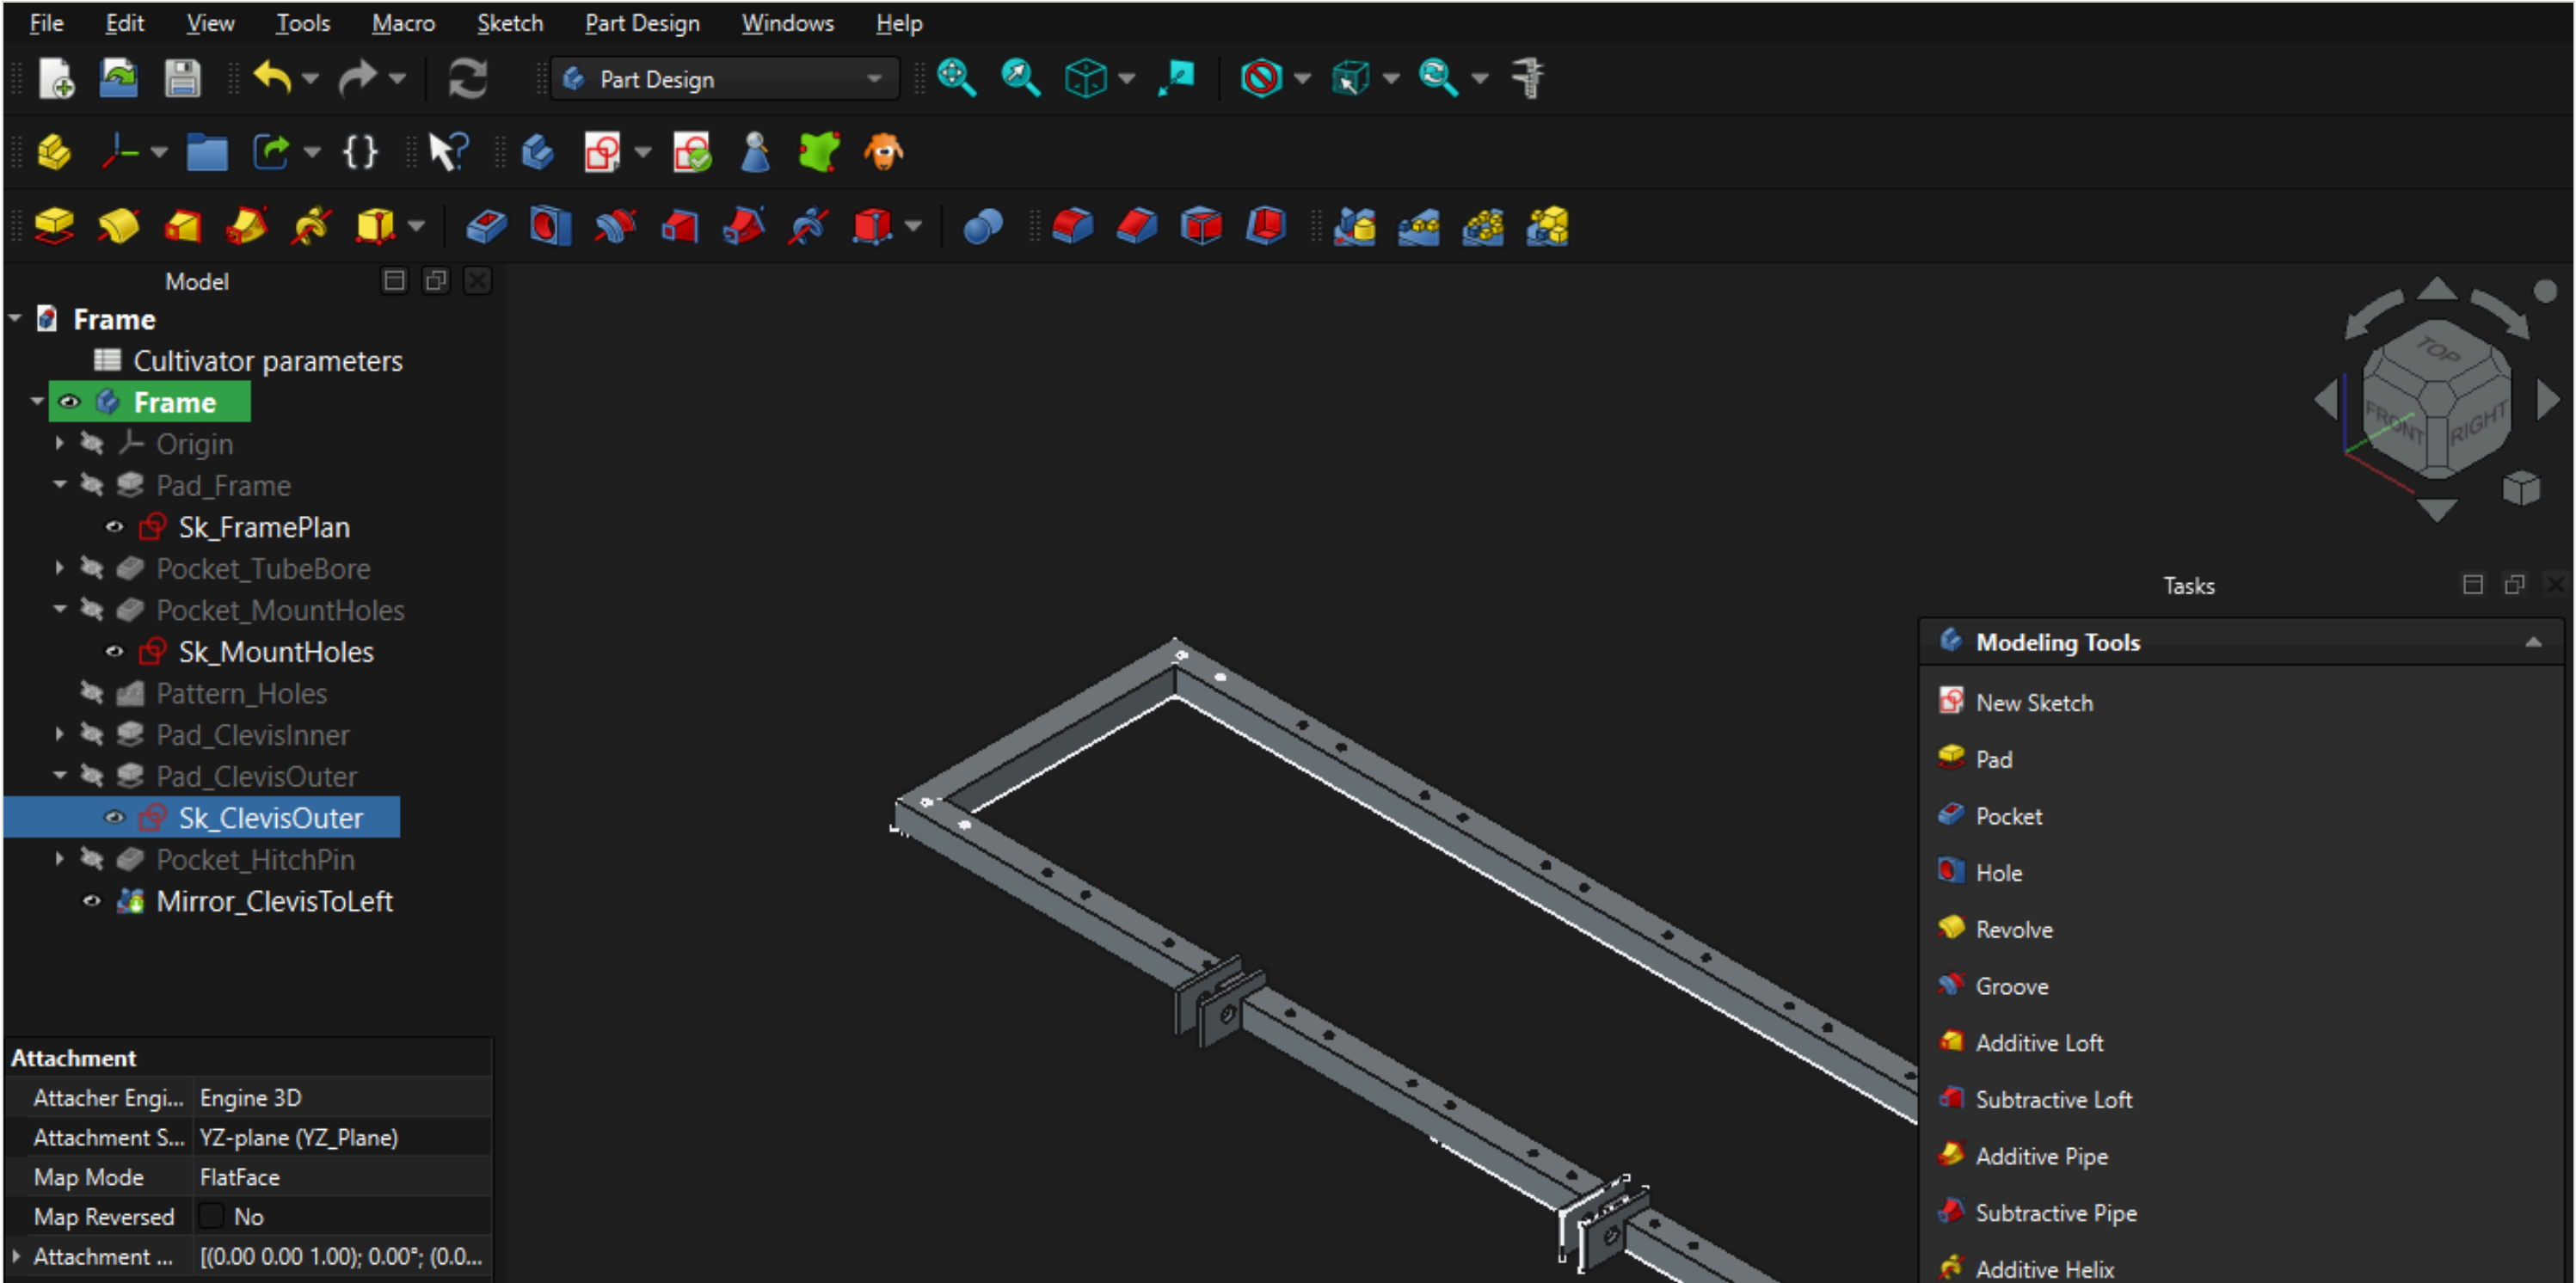

Nine stations from one

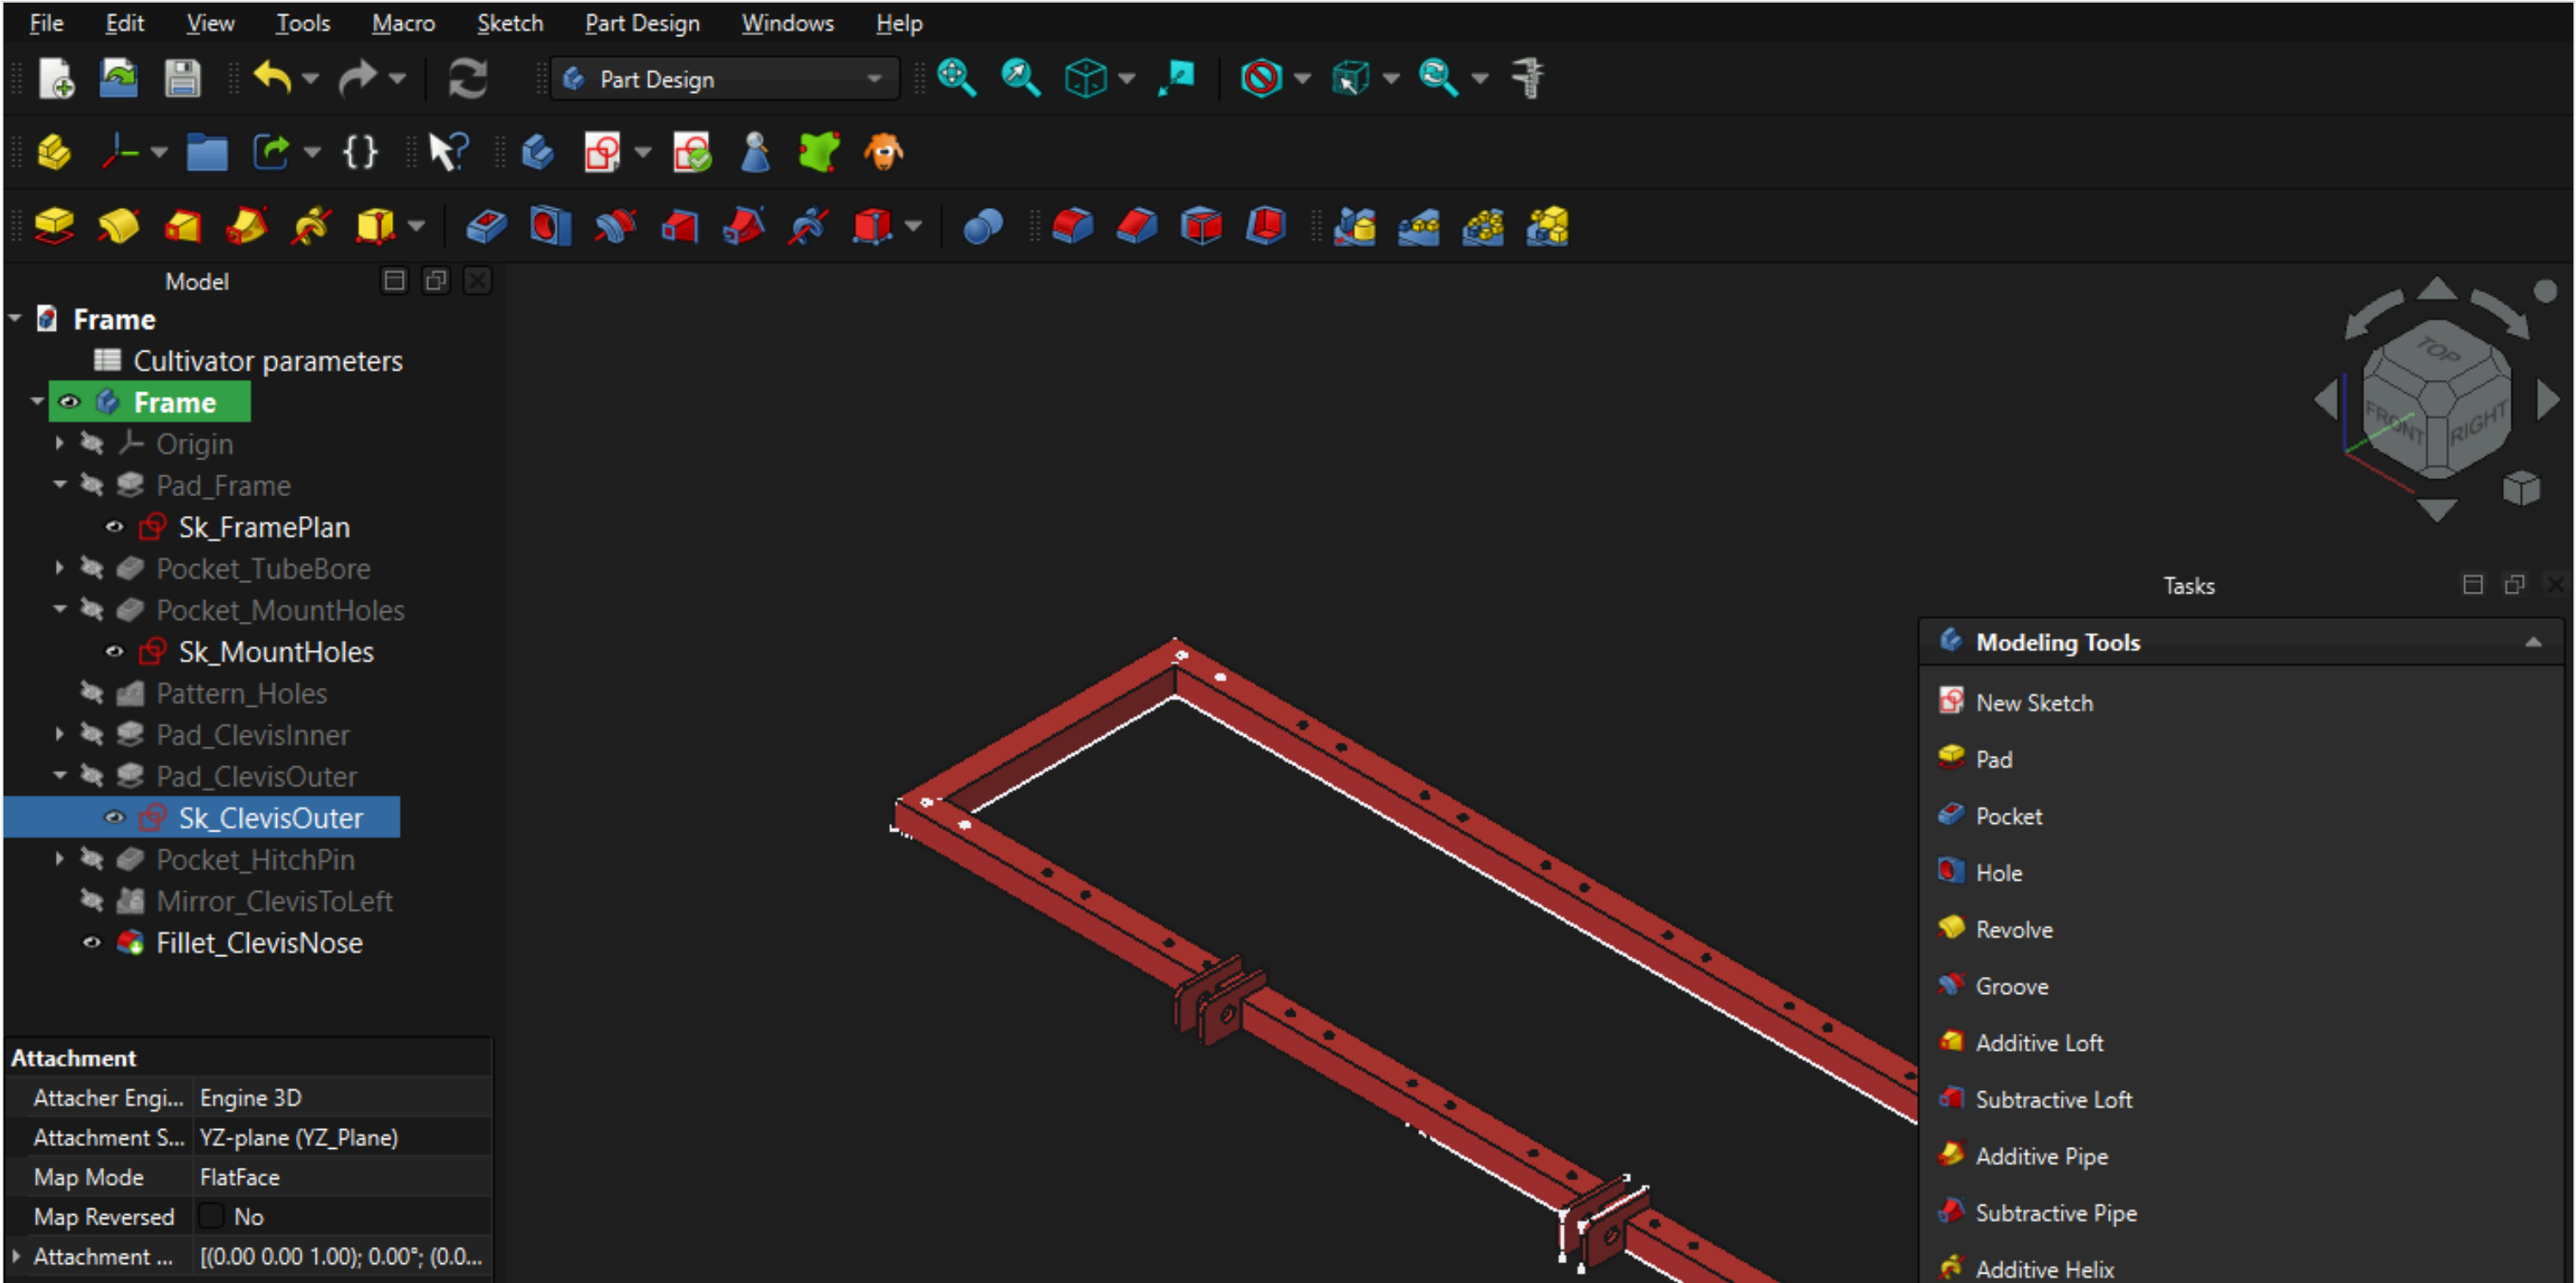

The hitch brackets

Pin hole, then mirror

A fillet that cannot exist

Check it before you move on
